Continuous irradiation chamber esp. for granular fodder - has coaxially divided compartments each containing rotating and revolving agitator
GEBRUDER SULZER AG 07.12.77-DT-754463
K08 (13.06.79) G21k-05/06

A device for irradiating flowable material, esp. granular fodder, comprises a cylindrical irradiation chamber in which the radiation source is contained in a coaxial, double-walled cylinder within the chamber. The material passes first on one side (e.g. the inside) of this radiation source and then on the other side before leaving the chamber.

In the annular space outside the double-walled radiation source container but inside the wall of the vessel, and also in the space inside the double-walled cylinder, there are agitators, at least one in each of these chambers, with their axes parallel to that of the vessel. Each agitator revolves around the axis of the vessel while simultaneously rotating to stir the material. More specifically, continuously operating conveyors feed and extract the material from the two chambers.

Thorough mixing of all the material is achieved so that it becomes thoroughly irradiated and needs to be cycled only once through the vessel. 7.12.77. as 754463 (18pp236)

Continuous band filter for food prods. - having caterpillar belt with filter cloth pressed onto drum which has sliding vanes to move cake around
, HITACHI KK 09.12.77-JA-147103
J01 (13.06.79) B01d-33/04

Filter consists of endless fabric belt which is fed around guide rollers. This is supported by a caterpillar type chain. Above it is a rotor with sliding vanes. The belt and the drum are tensioned together by a lever arrangement with cylinder.

Feed slurry enters from the top and is moved into the filter chamber between the drum and the belt by means of the sliding vanes in the drum. As the drum rotates the gap narrows and thus liquid is expelled from the cake. The cake leaves from the other side as belt moves round.

Used esp. for dewatering wheat gluten, pressing out

to the food indstry. Gives improved dewatering, w
separation chamber having circular profile, the ca
of which is adjustable to control the precise degre
dewatering. 7.12.78. as 852992 (16pp1053)

Appts. purifying water by anodic oxidn. - feeds cell from below ensuring constant, smooth flow speeds

SACHS SYSTEMTECHNIK 08.12.77-DT-754659
(13.06.79) C02b-01/82 C02c-05/12

Water to be purified is delivered from a high level to the bottom of a cell for anodic oxidation, and is made to flow from below upwards between the electrodes. The water is fed down a vertical passage into a heading chamber at the side of the cell, which opens into a diffusion chamber. This in size uniformly from the front to the back of the electrodes, and the feed passage opens into the heading chamber some distance from the wall of the chamber opposite to the diffusion chamber.

Used to elaborate a proposal to feed the water for anodic oxidn. from below and to extract it from above the electrodes, so that the water moves with constant speed during the electrolytic treatment. At the same time, a compact and cheap design prevents disturbance of the process, e.g. by gas bubbles. 8.12.77. as 754659 (13pp 1045)

Cooling water for use in petroleum purificn. plant - treated with ozone to regenerate hexavalent chromium anticorrosive agent and destroy slime
TOKYO SHIBAURA ELEC LTD 15.10.77-JA-122971
E36 H05 M14 (08.05.79) A01n-11 C02b-05 C23f-11/18 C23g-01/26

In a process for regenerating recycled cooling water the contg. chromate salt as an anticorrosive agent, the water is passed through various heat regenerators kept at high temps. to produce water having a high temp. and contg. trivalent chromium ions and chromium hydroxide ion. The resulting heated water is ozonised by adjusting simultaneously its pH and thereby, hexavalent chromium ion having the anticorrosive effect is regenerated in it. At the same time slime is stripped from internal wall of the pipings of the heat regenerator.

The ozone or ozonised water can be easily produced by silent electrical discharge with an ozone generator. The slime on the internal surface of the pipings generated by microorganisms is easily removed with the ozonised water. The cooling water system is used in a petroleum purificn. plant. 15.10.77 as 122971 (5pp15)

ured night soil-treated water resulting from aerating
soil water with microorganisms to remove COD and
components, is easily and effectively decolourised at
cost by contacting it with effective amt. of chlorine
or bromine, e.g. hypochlorite and/or hypobromite etc.
e presence of a metal peroxide, e.g. of Ni, Co, Cu
In, carried on a porous carrier, e.g. calcined attap-
e, diatomaceous earth, gamma-alumina, alpha-alum-
silica-alumina, zeolite, activated charcoal, silicon
ide etc.
n an example, 2 kgs. of a carrier obtd. by calcining
pulgite having granular size 0.2-0.5 mm in air at 600°
or 2 hrs. is impregnated with 2 mol/l-$NiSO_4$ aq. soln.,
r which the carrier is immersed in 15 l of 4% aq.
)H soln. for 3 hrs., followed by hydrolysis of $NiSO_4$ to
osit Ni hydroxide on the carrier. Thereafter, it is
nersed in 10 l of 12% aq. NaClO soln. for 3 hrs. to
vert Ni hydroxide into Ni peroxide, followed by water
hing to give a treating agent which exhibits excellent
olourising effect. 18.10.77 as 124080 (6pp34)

KK- ★ D15 46431B/25 ★J5 4058-949
ating waste water derived in recovering sugar from beet - by
phen's process, to reduce BOD and COD, involves adjusting pH,
culating with bacteria and activated sludge treatment
HOKKAIDO TOGYO KK 19.10.77-JA-124622
(D17) (12.05.79) C02c-01/14

The waste water is subjected to economical treatment to remove BOD- and COD-components.

Method comprises adjusting the pH to 7.0-8.5 with a mineral acid, e.g. H_2SO_4 etc.; inoculating with anaerobic bacteria, e.g. belonging to Clostrridium, Proteus, Pseudomonas, Bacillus, Streptococcus, Escherichia etc. followed by assimulation under anaerobic state for $\geqslant$3 days; the waste water to the fermented bacteria-assimulated liquor followed by retention for short period under an anaerobic state having oxidn.-reduction potential of -150 mV to -300 mV and temp. of 15 to 60°C, e.g. by electric or steam heating, or water amt. adjustment or ventilation etc. and treating the water thus treated e.g. by activated sludge process. 19.10.77 as 124622 (5pp34)

MITP ★ D15 46432B/25 ★J5 4058-950
Electrolytic removal of harmful metals from effluent - by forming iron(ii) floc incorporating the metals e.g. chromium ions, then heating to form magnetic iron cpd.
MITSUBISHI PETROCH KK (MITS-) 19.10.77-JA-124624
J01 (12.05.79) C02c-05/02

In the electrolytic removed of harmful metal components, e.g. Cr^{6+}, Ni^{2+}, Cu^{2+} and Zn^{2+} etc. from effluents by forming iron flocs and heating to form magnetic iron cpds., the improvement comprises forming ferrous-contg. iron flocs while maintaining condition such that matters having bad influence on the removal of the heavy metal components do not exist so that the harmful metal components are enclosed very stably by the magnetic iron cpd., e.g. ferrite etc. even in co-presence of inhibiting matters, e.g. PO_4^{-3} and Si components etc.

It is necessary to prevent the oxidn. of the ferrous iron in the iron flocs with air, otherwise the ferrite compsn. is damaged and the redissolution of the harmful metal components from a sludge may occur. The formation of the iron flocs may be also carried-out by reacting a ferrous salt, e.g. $FeSO_4$ etc. with alkali. 19.10.77 as 124624 (6pp34)

ASAH- ★ D15 46433B/25 ★J5 4058-951
Biological purificn. of starch- and/or sugar contg. waste water - by inoculating with fungi e.g. Mucor javanicus, aerating, cultivating then sepg. fungi from water
ASAHI CARBON KK (ODAM-) 19.10.77-JA-125291
(D17) (12.05.79) A23k-01 C02c-01/02 C12k-01

The waste water, e.g. discharged from brewing, starch, rice confectionery and cake-producing factory or food-processing factory etc. is purified biologically by inoculating with fungi selected from Mucor Javanicus, Rhizopus delemar and Aspergillus asumi mut. shiro-usamii, followed by aeration and culturing to decrease the content of the polluting matters, e.g. sugars and starch etc., and subsequently sepg. the fungi from the waste water.

The fungi does not produce harmful materials and exhibits excellent fixation property in the waste water and pollutants-dissolution degradation property, further exhibiting excellent suspended solids-removability and COD-removability. The amt. of the fungi inoculated is ca 500-1000 ppm against the waste water having the suspended solids and COD content of ca 2,000-3,000 ppm, and the pollutants are decreased until the min. value is obtd. within 40-70 hrs.

The process is suitable for the purificn. of the waste water having large variation in BOD and COD load. 19.10.77 as 125291 (10pp34)

MITR ★ D15 46434B/25 ★J5 4058-952
Coagulation of oil-contg. waste water - by kneading an inorganic cpd., a binder and an hydrophilic organic cpd., granulating, drying and passing the waste through the granules
MITSUBISHI RAYON KK 20.10.77-JA-125943
A81 J01 (12.05.79) C02c-05/02

An oil-contg. waste water is subjected to an oil-sepg. treatment by thoroughly kneading together an inorganic cpd., e.g. attapulgas clay, Mg aluminate, a mixt. of Mg aluminate and silica, iron oxide, iron hydroxide, iron oxyhydroxide, MgO and $Mg(OH)_2$, etc. a binder e.g. alumina sol, alumina gel, silica gel, cements, magnesia cement, water glass, coal tar, pitch, PVAc, EVA copolymer, acylic ester polymer and emulsion or latex of synthetic resin, e.g. styrene-butadiene copolymer etc., and a hydrophilic organic cpd., e.g. finely powdered cellulose etc. and granulating the mixt, e.g. by meansof a screw-type extruder.

Process further comprises drying or heating at 200°C under a gas stream to improve strength; charging the granules obtd. into a treating vessel, and subsequently passing forcedly the oil-contg. waste water through a layer of the granules, so that fine oil droplets ($< 10 \mu$) are coagulated together and rised to the surface of the water within short period without rise in pressure loss due to blinding of the granules layer. 20.10.77 as 125943 (5pp34)

C04 (D16) (15.05.79) C05f-03

The human waste is mixed with 0.1-40 pts. wt. (based on 100 pts. wt. waste) synthetic wollastonite, and 0.9-50 pts. wt.% sulphuric acid (98%) such that conc. sulphuric acid is dropped onto human wastes to release NH_3 and CO_2 gas with stirring and synthetic sollastonite is gradually added to the mixt. while stirring, the mixt. is allowed to stand for 5-20 mins. more stirring until the whole of the wastes is solidified into a jelly and the solidified wastes is dried by heating or under sunlight.

The method greatly shortens the time for solidification and water vaporisation of 1/2 to 1/5 days, resulting in finely divided, odourless solid. The solidification and water vaporisation is accelerated by the addn. of an inorganic salt, e.g. borax, etc., and an alkaline metals peroxide, e.g. sodium peroxide. 18.10.77 as 124014 (2pp)

Reinforcing and waterproofing ground - by treating with lime and brine, used for basin bottom construction for evapn. of brine in cooking salt mfr.
ZAITSEV I D 29.03.77-SU-485505
Q41 (11.08.78) E01c-07/36

The impermeability of soil to water on the bottom of basins for evaporation of brine can be increased and the cost of the treatment reduced if the soil is treated with brine mother liquor prior to reinforcement with lime, using an amt. of brine contg. 11-13 g. ions Mg per kg. of dry soil. The soil is then loosened to a depth of 50-60 mm., and mixed with lime at an excess of calcium oxide of 10-15% over the stoichiometric amt. required to convert the Mg salts to magnesium hydroxide. The magnesia-gypsum mixt. formed coats the soil particles and bonds them together, giving material with a high strength, stable for prolonged periods, with a low filtration capacity ensuring good waterproofing qualities.

Aeration chamber for mixing gas and waste water - has internal taper configuration with gas and water passages intersecting at step surface
CLEVEPAK CORP 22.11.77-JA-140555
(05.06.79) B01f-03/04 C02c-01/08

A system for aerating waste water e.g. sewage comprises a mixing chamber which provides a waste water passage and includes an extending chamber. The chamber is tapered and has a step surface at which gas passages intersect the chamber to form parallel gas and water streams. Helical canes may be disposed in each gas passage for keeping the mixing within the extending chamber. When the interface between the streams becomes unstable, vortices are created and produce tiny gas bubbles which mix with the water.

The helical vanes inject air into the extending chamber to create better wave generating conditions to extend the range to greater air flow rates. Tapering of the chamber permits operation at higher air flow rates without blowing the bubble forming vortices out of the chamber. The bubbles are tiny and create a good environment for effective use of the oxygen by the bacteria present. The system can be quickly installed in any existing aeration pond. Little energy is wasted in turbulent mixing. 22.12.77 as 863588 (9pp1044)

DAVIES T M C 17.11.78-GB-045017 (23.11.77-GB-048760)
B04 (20.06.79) C12c-11/34

The repeated removal and collection of low mol. wt. metabolites from cells comprises (1) contacting the cells with a membrane disruptant which (a) reduces the integrity of the membrane so as to allow escape of low mol. wt. metabolites into the surrounding medium, and (b) does not reduce the viability of the cells; (2) separating the cells from the metabolites before the metabolites have been reassimilated by the cells; (3) supplying the separated cells with nutrient for a time sufficient to allow restoration of the level of low mol. wt. metabolites to a level normally found prior to bud initiation; and (4) recycling the resulting cells to step (1).

Used esp. for obtaining nucleotides and amino acids from fungal cells such as yeast cells. The metabolites can be recovered from the cells without killing the cells, thus allowing the cells to be recycled and used repeatedly. 17.11.78 as 045017 (4pp914)

Filter aid for use in filtering alcoholic drinks - consists of refined linter fibre comprising mainly alpha-cellulose
DAICEL KK (KIKU-) 18.10.77-JA-124861
F09 J01 (10.05.79) B01d-37/02 B01d-39/18

Filter aid consists of refined linter fibre having an α-cellulose content of > 95%, a fibre length of 0.6-1.5 mm, and a degree of beating of 30-55°. The filter aid is used to filter alcohol drinks, e.g. sake, wine or beer. By adding the filter aid to the drink, hydrophilic impurities are adsorbed by the filter aid.

In an example, the refined linter fibre was produced by subjecting linter fibre to refining, beating, paper-making and wet disaggregation. The refined linter fibre obtd. consisted of 97.85 wt.% of α-cellulose, 0.11 wt.% of β-cellulose, 2.04 wt.% of γ-cellulose and 0.06 wt.% of fats and oils, and contained 18.57 ppm of Fe, 1.64 ppm of Cu and 2.74 ppm of Mn, and had a fibre length of 1.253 mm, a beating degree of 53° and a polymerisation degree of 1700-1800. 18.10.77 as 124861 (5pp86)

ORIY ★ D16 46305B/25 ★J5 4058-490
Compsn. for use in cholesterol determn. - contains methanol, reduced glutathione, NAD, cholesterol oxidase, catalase and formaldehyde dehydrogenase
ORIENTAL YEAST KK 19.10.77-JA-124482
B04 R16 (11.05.79) G01n-31/14 G01n-33/16

An agent for use in determining cholesterol comprises methanol 0.5-5 M., reduced type glutathione 0.5-1.5 mM., NAD 0.5-5.0 mM., cholesterol oxidase 0.2-5.0 µ./ml., catalase 25-1000 µ./ml. and formaldehyde dehydrogenase 0.5-5.0 µ./ml. (pH 7.0-9.0).

A method of determining cholesterol comprises treating formaldehyde, formed in the treatment of a cholesterol-contg. sample with cholesterol oxidase and catalase in the presence of methanol and oxygen, with formaldehyde dehydrogenase in the presence of reduced type glutathione to convert NAD into NADH, and determining the amt. of increased NADH.

Cholesterol in the blood, etc. can be precisely determined in short time. The increase of NADH is determined by an increase in the absorbance at 340 nm. 19.10.77 as 124482 (3pp50)

Antibiotic SU-2 - prepd. by culturing strain of micromonospora in nutrient medium

KYOWA FERMENTATION KK 18.10.77-JA-124030

B04 (12.05.79) C07g-11 C12d-09/14

Antibiotic SU-2 and its non-toxic acid addition salts are claimed. The antibiotic in a basic, white powder of elementary analysis: C 48.38%, H 8.72%, N 11.83% it has a mol. wt. of 450, molecular formula: $C_{19}H_{38}N_4O_8$ and m. pt. 102-112°C. It has no characteristic UV absorption band at 220-360 nm (in water) and is easily soluble in water, soluble in methanol, ethanol or acetone, and insoluble in chloroform, benzene, ethyl acetate, butyl acetate, ether, butanol, petroleum ether and n-hexane. It is positive to ninhydrin and potassium permanganate reactions, and negative to Elson-Morgan's and Biuret reactions.

The antibioitic shows broad antibacterial spectrum. The MIC (γ/ml) value as estimatedby agar dilution method is as follows: Pseudomonas alcaligenes KY 4655 (0.033), St. aureus ATCC 65389 (0.008), E. coli ATCC 26 (0.008), B. subtilis No. 10707 (0.00025), Proteus vulgalis ATCC 6897 (0.0167), Salmonella typhosa ATCC 9992 (0.0 pneumoniae ATCC 10031 (0.004).

The antibioitic SU-2 can be prepd. by cultivating antibioitic SU-2-producing strain of Micromonospor nutrient culture medium and recovering the antibiot the cultured broth. It is pref. prepd. by cultivating -monospora sagamiensis (NRRL 11,182) in a nutrie medium at 25-40 °C under neutral conditions for 1-1 18.10.77 as 124030 (9pp33)

Rotating disc-type biological waste water treatment appts. - with disc assembly comprising parallel discs fixed either side of impeller blade and including suction opening

DENGYOSHA MACH WORK 23.08.77-JA-100128

(05.06.79) B01d-21

A biological waste water treatment appts. comprises a rotating disc assembly carried on a rotatable shaft with discs having lower halves immersed in waste water retained in a tank. The assembly includes a plurality of centrifugal impellers arranged in parallel side-by-side relationship on the shaft. Each impeller includes a plurality of radial blades positioned between a pair of parallel discs. A suction opening is formed at the centre of one of the
discs. The rotating disc assemblies may be arran
parallel or in tandem. The outlet periphery of eac
discs may be closed by an annular band.

The appts. includes broad surface areas of rot
semblies for attaching microorganisms in spite of
axial length and achieves high purification perforn
without increasing driving power. The size of the
device is small due to the compact construction of
ing disc assembly. The appts. can perform both a
denitrification and aerobic oxidation and nitration.

Continuous sepn. of fructose from glucose - using a solid crystalline aluminosilicate zeolite
TORAY INDS INC 24.08.76-JA-100151
(05.06.79) C13k-01 C13k-03 C13k-11

Continuous, liq. phase sepn. of fructose (I) from a mixt. of (I) and glucose (II) is effected by selective sorption of (I) onto solid particles of a crystalline alumino-silicate or zeolite sorbent (III) using a simulated counter current flow system. Liq. streams are allowed to flow through desorption (D), rectification (R), and sorption (S) zones which are serially and circularly interconnected. Each zone consists of more than one serially interconnected section, each of which is packed with (III) particles.

Liq. feed mixt. is passed to the 1st (S) zone (S_1), and H_2O is passed (as desorbent) to D_1. A portion of the desorption effluent (consisting of the sorbate and H_2O) from the last section of (D) zone is withdrawn to afford (I). A portion of the raffinate effluent (contg. less sorbed sugars and H_2O) is withdrawn from a point such that $\geqslant 1$ section of (S) remains downstream of it. In addn., all the points of introducing and withdrawing the liq. streams into and from the sections are simultaneously moved one section at a time in a downstream direction at predetermined intervals while the same order of continuity and the same spacial relationship between the points are maintained. The liq. streams flow in the 3 zones without any interruption in flow between (D) and (R).

Economical, industrial scale process affords a ready sepn. of (I), a high-grade sweetener. 22.8.77 as 826640 (12pp478)

NEWSLETTER

8th August, 1979

1979 No.14

*1. 1979 INSTRUCTION CLASSES

Following a careful analysis of questionnaires returned by subscribers requesting centralised instruction classes, the following schedule has now been finalised. It had been hoped to accommodate requests for a larger number of centres, notably in the United States mid-west and in continental Europe, but the disappointingly low numbers expected to attend in contrast to London and Washington did not make these alternatives economically viable.

LONDON -

Royal National Hotel, Bedford Way, W.C.1.
(For reservations tel. 01-278-7871, Telex 263951 (Imperial Hotel Gp. Central Reservations)).

Monday Sept. 10th	IC2	Introductory Coding & Retrieval Section A

Monday Nov. 12th Tuesday Nov. 13th	IC7	Advanced Coding & Retrieval Sections BCE
Thursday Nov. 15th Friday Nov. 16th	IC6	Advanced Coding & Retrieval Section A

Costs for centralised classes will be £20 ($50) per person per day (luncheon not included) except for online classes where the costs are £30 ($75) per attendee per day. Classes will commence at 9.00 a.m. on each day.

All subscribers who returned questionnaires requesting such centralized classes have been contacted by letter confirming details. Those wishing to attend should make their own arrangements for accommodation and are advised to do so well in advance.

A series of individual classes at subscribers' own offices has also been arranged (cost £100 or $250 per one day visit) and those who requested this option are currently being advised of the details by letter.

Any subscribers who have not previously returned their Instruction Class Questionnaire, but now wish to attend should contact the Subscription Department immediately, preferably by telex and any correspondence should be sent by First Class Post (Airmail outside Europe).

*2. DELAYS TO CANADIAN PATENTS

Due to despatch delays from Canada, caused by a strike of the shipping agents, no Canadian patents have been included in Weeks B30 and B31. The dispute has now been settled and the missing patents will be caught up in Weeks B32 and B33.

*3. NEW CHEMICAL CODE

A very successful meeting of the chemical coding sub-committee was held on 26th and 27th July, with agreement being reached on virtually all outstanding items.

The sub-committee consisted of Derwent staff, Mr. J.D. Munro (ICI), Dr. O. Schier (Ciba-Geigy), Mr. P. Steele (Glaxo), Dr. C. Suhr (BASF). Suggestions from other subscribers were included in the discussions.

A full report of this meeting will be sent, by the end of August, to all members of Subscriber Committee No. 5 (chemical coding), for their comments.

4. INSTRUCTION MANUAL NO. 3 MANUAL CODE MANUAL

The new April 1979 version of this manual was sent to all eligible subscribers with the week B22 consignment of material. Further copies are available to these subscribers on request at a cost of £2 ($4) each. Orders should be placed with our Patents Supply Division.

Amt. of fluoride ion used is

5. WPI GAZETTES - NEW INDEX FORMATS

As announced in Item No. 3 of Newsletter No. 12 (11th July, 1979), the formats of Indexes I, III and VI were altered with effect from week B24. Details of these changes were given in the Subscriber Meeting Agenda booklets, and the green descriptor page preceding each index in the WPI Gazettes will also show the revised formats.

In order to improve scanning still further, from week B26, in Indexes I (Patentee) and III (IPC), the first part of the title will additionally be printed in bold.

6. SDC SAVESEARCH/STORESEARCH

SDC have now corrected the bug in their Savesearch/Storesearch program and multipunch searching under several subheadings may now be effected as described in CPI Newsletter No. 9 Item 10. The method described in CPI Newsletters 11 and 12 can of course still be used, if preferred.

*7. SDC ONLINE FILE POSITION

WPI	SDC has updated to	Update code	Despatched to SDC

*(13.06.79) *DT1811-290 C08h-01/06 + C08l-89/06*

Felt-like membranes or sponge-like pads of collagen fibres are prepd. easily and cheaply. Collagen-rich animal tissue such as skin and tendons is degraded by acid and/or alkali and mechanically pulverised. The resulting compsn. is mixed with water and foamed with air and/or an inert gas to obtain a homogenous, foamy slurry contg. 0.3-3.0 wt.% (based on dry wt.) collagen.

The pH of the slurry is adjusted to 3-5.5 and tannic acid or a crosslinking agent and opt. plasticisers, therapeutic or diagnostic agents added. The foamed slurry is frozen to -2 to -40 °C and maintained 1-30 days at this temp. under normal pressure. The compsn. is then brought to 10-30 °C, the major amt. of water present pressed out mechanically and the structure dried at room temp. The collagen pads may be used as tampons and bandages. 27.11.68 as 811290 (9pp068)

NIDS D22 35367U/25 =DS 2258-940
Microwave sterilizer plant - for liquid filled ampoules
NIHON DENSHI KK (TANA) 21.02.72-JA-018261 (01.12.71-JA-097434)
*B07 P33 P34 + R59 (13.06.79) *NL7216-260 A61l-01*

The fluid contained in ampoules is sterilised whilst uniform heating of the ampoule and its contents are ensured, so that the ampoule itself cannot be destroyed nor its contents damaged.

The ampoule is held by its neck section and rotated on its longitudinal axis whilst being subjected to microwave radiation, the ampoules being held at an inclination ensuring that no liq. enters the neck. 1.12.72 as 258940(11pp)

PAPI- D22 09285X/06 =DS 2539-570
Mechanical pulps for producing water-absorbent paper - contg. a non-borate buffer to improve hydrophilic props
PAPIRIND FORSKNING 12.09.74-NO-003286
*F09 (13.06.79) *BE-833-343 D21h-03/70*

An easily handled wood pulp with high absorptive powers contains at least 0.2 wt.% of a buffer not contg. borate which gives a pH of 6-10(7-9) e.g. an alkali or ammonium salt of phosphoric, carbonic, citric and/or tartaric acids.

The wood pulp may be used for bandages, tampons, towels, etc. 5.9.75 as 539570(3pp068)

OVTS/ D22 29594Y/17 #DS 2550-828
Bactericidal (1,3)-dichloro-(5,5)-dimethyl hydantoin compsn. - useful for washing and disinfecting various surfaces
OVTSCHINNIKOV V G (OVCH/) 11.11.75-GB-046617 (12.11.75-DT-550828)
*E13 P34 (13.06.79) *GB1472-049 A61l-13 C11d-03/48*

Bactericide contains 19-25 wt.% 1,3-dichloro-5,5-dimethylhydantoin, 10-19 wt.% 5,5-dimethylhydantoin, 7-15 wt.% neutral sodium salt of phosphoric acid, 59-40 wt.% sodium chloride and/or anhydrous sodium sulphate and 5-1 wt.% alkylarylsulphonate and/or alkylsulphonate.

The bactericide may be used for washing and disinfecting various surfaces. 12.11.75 as 550828(10pp068)

COLG D22 90087Y/51 =GB 1547-524
Disposable sanitary towel or diaper - with two absorbent pads having different degrees of compaction
COLGATE PALMOLIVE CO 09.08.76-US-712448
*F07 P21 P32 (20.06.79) *BE-857-609 A41b-13/02*

A disposable absorbent article, e.g. a diaper, comprises a fluid-impervious backing sheet, a pervious cover, a top absorbent pad of a loosely formed fibrous mass, and a lower absorbent pad of a fibre mass with interconnected compressed regions extending through a substantial part of the pad, in which the average interfibre spacings are less than those in uncompressed areas and the top pad.

The pad outer surfaces are pref. covered by wadding sheets, the lower being compressed in regions corresponding to the second pad regions. The second pad is pref. 37 ± 9 mils thick measured under slight compression, and the regions extend to the sides and ends. 26. 7. 77 as 031333/77 (4pp1358)

KUWA/ ★ D22 46111B/25 ★J5 4056-980
Deodorising appts. for gases from drying waste, fertiliser or fodder - comprises a sealed casing, with inlet and outlet ports, contg. agitator compartments for washing, and others for deodorising the gases
KUWABARA H 15.10.77-JA-123006
J01 Q78 (D14 D15) (08.05.79) B01d-53/14 F28b-03/08

The appts. comprises a sealed casing with an inlet port for exhaust gas in the top wall near one end and an outlet port for the treated gas near the opposite end. A number of spaced, vertically extending partition walls divide the interior space of the casing into isolated compartments, each having water spray nozzles. An agitator shaft extends through the partition walls, from end to end of the housing, with agitating blades rotating within the individual compartments.

The gas pref. passes vertically downwards in alternate compartments to be agitated and mixed with the water spray, and vertically upwards in the remaining compartments to be washed and cleared of the smelly components. 15. 10. 77 as 123006 (3pp47)

Bactericidal and bio-stimulating medicinal aq. compsn. - contg. sodium chloride, cod liver oil oxidn. prods. and water, used for treating infected wounds etc.
GORGIEV T B 11.03.68-SU-223760
B05 (20.01.79) A61k-35/60

Both bactericidal activity and biostimulation are increased and unpleasant smell is removed, by using the components in the following ratio (wt.%): cod liver oil oxidn. prods. 4-6, NaCl 0.5-0.9, remainder - water.

It is used for treating wounds. It stimulates the growth of granular tissue and regeneration of epitherial tissue.

The liquid is pale yellow, transparent and of slight odour. It contains a little sediment at pH3, but can be neutralised. The liquid is bactericidal to many species, S. albus, S. aureus, dysenteric bacteria, cholera, bruella, all of which are destroyed after 5 min. to 3-4 hrs. It stimulates growth, granulation and regeneration of epithelium.

Human blood vessel replacement - has nap on both sides made as single, knitted tube contg. biologically inert fibres
TEXTILE-HABERDASHER 14.10.76-SU-411517
F04 P32 (02.08.78) A61f-01/24 D04b-01/22

The fibre knitted blood vessel has nap on both sides and is made as a single tube knitted from biologically inert threads.

To reduce blood flow turbulence and therefore thrombosis and improve the functional properties, the nap elements on the inner side are the covering loop rods which are orientated in the blood flow direction. On the support outer side the same covering thread forms additional nap elements w.r.t. the ground thread.

The additional nap elements are made as needle arches. The needle arches alternate with the nap elements made as plate arches.

The washing and cleaning products contain 0.2-5% of diphosphoric acid cpd of formula (I) $R-C(PO_3H_2)_2-N(CH_2COOR_1)$ (I) in which R is H or methyl and R_1 is H, alkali metal or NH_4.

The detergence auxiliary cpds, unlike previously proposed cpds, can be prepd. from readily available materials, are very soluble and have an increased detergence power enabling lower concns to be used.

The products pref contain 0.2-5% of the above cpds, 15-30% of an alkali metal triphosphate, 6-25% of at least surfactant, and 30-78.8% of at least one washing auxiliary or of another detergence auxiliary. Specified surfactants are dodecyl benzene sulphonate, a tallowalkyl fatty alcohol 11 times ethoxylated, or a scrap of hardened tallow. Specified additives are sodium tripolyphosphate, magnesium and sodium silicates, sodium perborate $4H_2O$, sodium sulphate, and CMC. 18.12.78 as 872852 (11pp597)

ZIMZ/ ★ D25 45735B/25 ★DS 2819-940

Detergent, cleansing and cosmetic and/or medicinal soaps - are derived from fermented whey inoculated and fermented with lactic acid bacillus

ZIMZIK H 06.05.78-DT-819940

(D16 D21) (13.06.79) C11d-03/16 C12d-13

Wash-active substances are prepd. by (a) adding sugar-contg. cpds. to whey; (b) subjecting the soln. obtd. first to an alcoholic and then to an aerobic fermentation; (c) inoculating the whey obtd. with lactic acid bacillus from a pure culture and fermenting and (d) adding surfactants and/or other materials to the fermented whey.

The whey is used for mfg. rinses, household cleansers, detergents for fine fabrics, medicinal and cosmetic soaps. The cleansers and detergents are biologically degradable and cause no pollution. The compsns. require no addn. of phosphates and alkalies which might irritate the skin. 6.5.78 as 819940(4pp200)

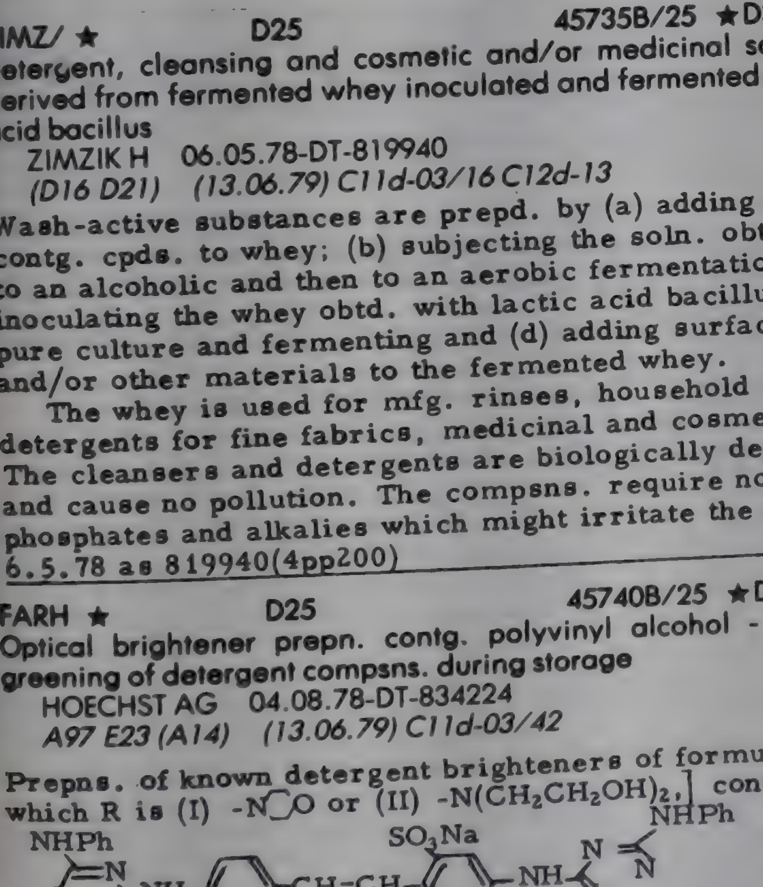
FARH ★ D25 45740B/25 ★DS 2834-224

Optical brightener prepn. contg. polyvinyl alcohol - to reduce greening of detergent compsns. during storage

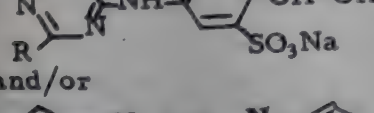
HOECHST AG 04.08.78-DT-834224

A97 E23 (A14) (13.06.79) C11d-03/42

Prepns. of known detergent brighteners of formula [in which R is (I) -N◯O or (II) $-N(CH_2CH_2OH)_2$,] contain 1-100 wt. % polyvinyl alcohol based on wt. of brightener.



and/or



In solid detergent mixts. for use as washing powders. Greening of detergent mixts contg. sec. alkane sulphonates, esp. during storage at

Polyvinyl alcohol of hydrolysis grade 60-100 (80-100) % is used, in amount of 10.50 wt.%.

The brightener is mixed with an aqueous soln. of polyvinyl alcohol which is then dried and pulverised. Pref. spray drying is used, with inlet temp. 150-350°(200-220°C)

10 g. brightener (I) as 70% mixt. with NaCl, is added to 25 wt. 4% aq. soln. of polyvinyl alcohol with polymerisation grade 530 ard.4.8.78 as 834224(5pp195)

BADI ★ D25 45741B/25 ★DS 2841-076

Liquefying aq. amide-contg. textile softener compsns. - by adding amide derivs. of asymmetric substd. alkylene di:amine and higher fatty acid

BASF AG 21.09.78-DT-841076

E16 F06 (13.06.79) D06m-13/36

Aq. textile softeners contg., as active ingredient, 15-40 wt.% condensates, (A) of 1 mol di- or tri-hydroxyalkylamine having formula $(R^1-NCH_2-CHR^2OH)_2$ (I) (where R^1 is H, Me to C_4H_9, hydroxyethyl or 2-hydroxypropyl and R^2 is H or Me) with 0.8-2 mol 16-18 C fatty acid, as an organic or inorganic salt or quat. amine deriv., are liquefied by adding 3-15 wt.%, w.r.t. (A), of amides having formula $R^3R^4N-(CH_2)_n-CHR^5-NH-CO-R^6$ (II) (where n is integer 1-4; R^3 and R^4 are Me, Et or Pr; R^5 is H or Me; R^6 is 7-13 C alkyl, $\geq$ 7 of which are in one chain), as the salts or organic or inorganic acids, and setting to pH 2.5-6.

(II) can liquefy (A) without impairing softening activity. The compsns. have liq. consistency and solubility in cold water, are easily handled and measured out. 21.9.78 as 841076(7pp200)

SENP ★ D25 46067B/25 ★J5 4056-852

Cleaning fluid for contact lens - contains urea and/or guanidine acid salt and reducing agent

SENJU SEIYAKU KK 14.10.77-JA-123649

E19 R21 (E37) (08.05.79) G02c-13

The cleaning fluid contains (a) urea and/or guanidine acid salt and (b) a reducing agent, (b-1) sulphite, (b-2) pyrosulphite, (b-3) dithionite, (b-4) sodium boron hydride or (b-5) reducible and water-soluble organic cpd. contg. a mercapto gp.

The cleaning fluid easily removes proteins from a contact lens.

The guanidine acid salts include the hydrochloride, hydrobromide and hydroiodide salts. The concn. of (a) is 20-60 w/v%. (b) is used in a concn. in which the intra- or inter-molecular S-S bondings in the protein are reduced, pref. 0.1-1.0 w/v%. (b-1), (b-2), (b-3) and (b-4) include their alkali metal salts and alkaline earth metal salts. (b-5) are, e.g. cysteine, acetylcysteine, carbamoylcysteine, cystenyl glycin, ω-mercaptoethanol, etc.

Contact lens is cleaned by dipping it in the cleaning soln. opt. under heating for 5-1 hrs. 14.10.77 as 123649 (5pp90)

LIOY ★ D25 46204B/25 ★J5 4057-504

Finishing agent for dry cleaning - contains amphoteric amino-amine surfactant and polyoxyalkylene alkylphenyl ether phosphate

LION FAT & OIL KK 15.10.77-JA-124289

A97 E16 (A25 E01 E12) (09.05.79) C11d-01/94

The finishing agent contains a mixt. of 20-80 wt. % of amphoteric aminoamine surfactant of formula $R-CON(X)CH_2-CH_2N(Y)(Z)$ (I) (where R is 8-20C alkyl X:H or CH_2CH_2OH, Y : CH_2CH_2OH or CH_2CH_2COOM and M is alkali(ne earth) metal, Z is CH_2COOM or CH_2CH_2COOM) and 80-20 wt. % polyoxyalkylenealkylphenylether phosphate of formula $R'-O(CH_2CHO(R''))_n-P(O)(X')(Y')$ (where R' is phenyl having 8-12C alkyl substit., R" is H or CH_3, n is 3-10, X' and Y' is OH or $R'-O(CH_2.C(R'')HO)_n$).

Laundry is prevented from being charged with electricity. Softness can be afforded to laundry. Specifically, the mixt. is diluted with diluent (e.g., petroleum solvent, halogenated hydrocarbon) or with coupling agent (e.g. methanol, ethanol, ethyleneglycol, butylcellosolve, isopropanol) having 0.8-3.0 times the wt. of that of the mixt. The mixt. may be blended with anticorrosive for metals, fluorescence agent, etc. 15. 10. 77 as 124289 (6pp170)

INUI/ ★ D25 46309B/25 ★J5 4058-575
Soap for mfr. of artificial flowers - contains alcohol cpds., sugar, water and perfume
INUI E 17.10.77-JA-124777
P21 (11.05.79) A41g-01 C11d-13

Undried soap for mfr. of artificial flowers comprises 22-32 wt.% alcohol cpds.; 5-15 wt.% sugar; 12-25 wt.% water; and a suitable amt. of perfume; the alcohol cpds. contain > 10 wt.% glycerine, > 60 wt.% ethanol.

Artificial flowers of beautiful, three-dimensional appearance are mfd. emitting a lasting perfume. The artificial flowers can beused as soap after use. 17. 10. 77 as 124777 (3pp50)

DAII ★ D25 46356B/25 ★J5 4058-693
Synthetic alcohol ester sulphate composite for washing wool - contains lanolin alcohol and/or fatty acid deriv., and alcohol ester sulphate
DAIICHI KOGYO SEIYAKU 19.10.77-JA-126003
A97 E17 F01 (E11) (11.05.79) C11d-01/14 C11d-03/20 C11d-10/02

The composite is obtained by mixing 2-110 wt. % of a lanolin alcohol deriv. and/or a lanolin fatty acid deriv. with synthetic alcohol ester sulphate. The synthetic alcohol ester sulphate is obtained by sulphating 8-22C synthetic alcohol with a sulphating agent, such as, H_2SO_4, chlorosulphonic acid, or fuming H_2SO_4, and thereafter neutralising it with NaOH or KOH.

The lanolin alcohol deriv. is ester sulphate or ester phosphate of lanolin alcohol, or ester sulphate or ester phosphate of polyoxyethylene ether. The lanolin fatty acid deriv. is ester sulphate, ester phosphate, polyoxyethylene ester or multivalent alcohol ester of lanolin fatty acid, or ester sulphate or ester phosphate of lanolin fatty acid low grade alcohol ester.

When wool is washed with the composite, it feels soft and wet. 19. 10. 77 as 126003 (4pp51)

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distingui accepted West German specifications (DAS) from unexamined applications (OLS) which are given the no DT code. in the case of Japan J5 represents unexamined applications, and J7 the examined of present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry
A+	Polymer Applns.
AE	Polymer & General Chemistry
B	Pharmaceuticals
C	Agricultural Chemistry
D	Food, Disinfectants, Detergents
E	General Chemistry
E+	General Chemistry Applns.
F	Textiles, Paper, Cellulose
G	Printing, Coating, Photographic Chemistry
H	Petroleum
J	Chemical Engineering
K	Nucleonics, Explosives, Protection
L	Refractories, Ceramics
M	Metallurgy

Typical Abstract Heading

See CPI/WPI Instruction Manual No. 1A for explanation of the various flagged descriptors.

★ D11 47245B/26 ★CA 1056-200
layer dough improver tablets - contg. oxidising layer, additive , and intermediate inert barrier salt layer
NNWALT CORP 17.05.74-US-470766
(12.06.79) A21d-02

i-layer tablet for improving flour and dough consists layer of a strong oxidising agent (I) and a layer of org- chemical flour and dough additives (II) which are sepd n inert barrier layer of a salt (III) which is an accep- e edible filler for flour additive compsns.

Tablets are as effective in improving and maturing r and doughs as conventional tablets, but have reduced and/or explosive potential, and longer shelf life, etc. 3.75 as 221894 (18pp478)

C D11 42838R/24 #DS 1767-943
s or crisps from dehydrated potato
PROCTER & GAMBLE CO 31.07.68-GB-036543 (04.07.68-DT-767943)
*D13) (21.06.79) *GB1195-138 A23l-01/21*

sp savoury potato chips are made from dehydrated, oked potato contg. 0-5 wt.% of reduced sugar and with ine number of 0.01-6. The potato is mixed with water form a dough contg. 25-55 wt.% of water and with a lip- content (Y) defined by $Y=AX^{0.40}$ (where $A \leqslant 2.7$; and is the iodine number of the potato)

The chips have the taste and appearance of chipped pot- oes. 4.7.68 as 767943(10pp68)

NI/ D11 79794Y/45 =DS 2717-410
ugh tipping mechanism - using vertically movable driven friction lers to engage friction wheels with flats on tiltable troughs
KONIG H 23.04.76-OE-003002
*(21.06.79) *DT2717-410 A21c-09*

tipping device for lumps of dough which are transported hinged troughs on an endless chain is based on a circ- lar roller, fixed to one end wall of each trough and lines ith a friction material. A roller which is driven at a peed higher than the chain speed is made to engage the riction lining to perform the tipping. A flat on the fixed oller interrupts the turning motion and an adjustable stop estricts the angle through which the trough is tipped.

The fast action ensures a reliable removal of the lumps f dough from the troughs. 20.4.77 as 717410(9pp39)

CHI- ★ D11 47253B/26 ★DS 2812-543
wollen germinated whole cereal grain prepn. for bread mfr. - by ixing with water, heating, cooling and adding more water
ACHIMER SIMONSBROT 22.03.78-DT-812543
(21.06.79) A21d-13/02

Germinated cereal grains, to be used as an aq. paste in bread mfr., are treated by (i) mixing 10 pts. wt. of germ- inated whole cereal gains with 15-18 pts. wt. cold water at 10°C; (ii) heating to ≥85°C for 45 min. and then (iii) cooling the mixt. to <20 (10)°C with the addn. of 5-2 pts. wt. cold water at <10°C.

Highly swollen gains are obtd., which can be used whole in bread mfr., without risk of damage. Acid form- ation is prevented by shock cooling. 22.3.78 as 812543(4 pp200)

ACHI- ★ D11 47254B/26 ★DS 2812-544
Pre-swelling whole cereal grains for bread mfr. - by adding water, heating, and cooling with further cold water addn.
ACHIMER SIMONSBROT 22.03.78-DT-812544
(21.06.79) A21d-13/02

Whole cereal grains for bread mfr. are pre-swelled by (a) mixing 10 pts. wt. cereal gains with 15-18 pts. wt. cold water at 10°C; (b) heating the mixt. in <60 min., with const. stirring, to hot-swelling temp. >85°C, for 45 min. constant stirring, at a total gains : water wt. ratio 1 : 2.

The 2-step swelling yields grains which can be proce- ssed to bread without damage during dough prepn. The dough could be baked well, yielding a tasty wholemeal bread which retained its freshness over a long period. 22.3.78 as 812544(3pp200)

Machine for folding dough strips - across the strip especially for initial folding for puff pastry

SEEWER MASCHIN AG 17.08.74-DT-439496

*(15.06.79) *NL7509-745 A21c-03*

A machine is described for folding a strip of dough so that, when divided into three portions, the two outer portions are folded together to lay flat on the central portion. The machine comprises a downwardly inclined feed conveyor and an upwardly inclined reversing conveyor symmetrically placed with respect to the first conveyor. The lower axes of the two conveyors are mounted on swing arms linked at a common pivot so that they can be swung together or apart. A third conveyor, also capable of reversing is mounted below the opening between the first two conveyors. By appropriate stepped movements of the three conveyors, the folded dough is laid on the lower conveyor and transported away.

The device is capable of handling very thin layers of dough and, under some circumstances may operate
two pieces of dough in the machine at the same tim
that a greatly increased prodn. rate is achieved.

GIYO CO LTD 16.12.77-US-861217
(12.06.79) A22c-25 A23l-01/32

A crab meat substitute is prepd. by heating mashed fish in a mould to gel it and form a moulding of jelly strength 300-1500g.; and shredding the moulded fish into fibre-like pieces of width 0.25-3.0mm and cross-sectional area up to $2.25mm^2$.

Fibres of the stated jelly strength and dimensions are similar to myotomes of crab muscle, so the prod. has a realistic texture. 16.12.77 as 861217 (10pp955).

Processing animal carcass, bone and meat waste - by enzymatic alkaline or acid hydrolysis opt. after protein denaturation, giving prods. useful in foodstuffs, feedstuffs and fertilisers
FREUDENBERG, CARL FA 20.12.77-DT-756739
C03 (C04 D12 D16) (21.06.79) C07g-07

Comminuted animal carcase-, bone- and meat waste is enzymatically hydrolysed, opt. after an acid or alkaline protein denaturation at 100°C and cooling to 30-70 (50)°C. Hydrolysis takes place at the optimum pH for the enzyme used. Fat and protein hydrolysate are then sepd. from one another, by unmixing, e.g. by centrifuging at 80-100°C, and the insoluble residue is opt. filtered off.

The protein prods. can be used in super-protein diets, or as food additives e.g. in diabetic foods, soup flavours, animal feedstuffs, etc. The difficultly soluble residue obtd. in bone processing can be used as fertiliser or as animal feedstuff additive. Waste prod. treatment is quick, e.g. 3 hrs.; non-polluting and odourless. Water-insoluble protein hydrolysates are obtd. in high yields. 20.12.77 as 756739 (10pp200)

Enzymatic protein hydrolysate prepn. from oil seeds - using Bacterium Streptococcus faecalis var liquefaciens as protease generator
KOLB H 20.12.77-DT-757366
(D16) (21.06.79) A23j-01/14 C12d-13/06

Gp. D Bacterium Streptococcus faecalis var liquefaciens is used as extracellular protease generator in protein hydrolysate prepn. from oil seeds, esp. from so-called press-cakes, e.g. soyabean press-cakes. The bacterium is pref. added in quantities over 1 x 10^7 organisms to heated soya milk obtd. by comminuting press-cakes. Bacterial growth and proteolysis take place at 36-40°C and pH 6.5-7.5. After proteolysis, insoluble constituents, esp. cellulose, and also the bacteria, are removed by centrifuging or filtration.

The proteolysis prod. contains about 3% protein hydrolysate and can be used for protein-enrichment of foods. The hydrolysate can be evaporated to dryness and used in mfr. of bread, cereals, confectionery, pudding- and soup powders, etc. The protease can be separated and used as beer stabiliser, as papain replacement for tenderising meat, in cheese mfr. for liquefying slaughterhouse waste to produce animal feedstuffs and in pharmaceutical industry. 20.12.77 as 757366 (13pp200)

Mixt. is prepd. from 1 pt. wt. tricalcium phosphate, 0.005-
pt. wt. carob bean gum and $\geqslant$25 pts. wt. water, dried
and crushed. Further tricalcium phosphate of particle
size $>$130 µm as $\leqslant$ 2 times total dried mixt. and 5-15wt.%
gum (on total mixt.) is added. The powder is then com-
bined with the active constituent and a lubricant, and tab-
letted.

Pref. 1-7wt.% pharmacologically acceptable, acid-re-
acting component (esp. citric acid) is added based on dry
phosphate-gum mixt. Tablets obtd. have good strength
and dispersibility. 16.5.75 as 005803. (4pp913)

UNIL D13 62554Z/00 =NL-160-606

Edible fat prodn. - from triglyceride oil fatty acids

UNILEVER NV 09.08.67-GB-036657

*(D23) (15.06.79) *BE-719-138 C11c-03/12*

An edible hardened fat is prepd. by (a) selective hydrogen-
ation of a triglyceride oil in which 25-85wt.% pf the total
fatty acid residues are 20-22C unsatd. fatty acid residues,
and (b) isolation of a stearin fraction with a dilatation val-
ue of $\not<$1400 at 20°C and $<$300 at 35°C. Hydrogenation
is continued until the iodine number is 70-85 and the drop
in iodine number during hydrogenation is $\not<$15, and the
trans-index has been brought to 50-80.

The hardened oil has a lower content of high-melting
triglycerides, so that a smaller proportion has to be re-
moved during the fractionation. The initial oil pref. con-
tains 25-60% erucic acid and has a low content of $\not>$12C
fatty acids. In partic., the oil contains $<$10wt.% of satd.
fatty acid residues and has an iodine number of 90-120,
and is hydrogenated so that the increase in the content of
satd. fatty acid residues is $<$6wt.% of the total fatty acid
residues, and the iodine number of the hardened oil is 72-

The fat is esp. used in prodn. of confectionery. 2.8.68 as 010982. (10pp510)

DAIR= ★ D13 48721B/26 ★SU-622-461

Additive for dairy products esp. for cream cheese - prepd. by concentrating mixt. of whey and skimmed milk and introducing fine nucleating crystals of lactose for improved consistency

DAIRY IND RES INST 10.12.76-SU-428738

(17.07.78) A23c-21

Additive for dairy products, esp. for cream cheese is prepd. by pasteurising whey, concentrating it to a solids content of 60-65%, and cooling to 25-30°C. This method is improved by adding skimmed milk to the whey before concentrating the latter and, after the concentration, heating the mixt. to 80-85°C and then cooling by stirring whilst introducing nucleating lactose crystals at 55-60°C. The skimmed milk is added in an amt. of 15-20% and the nucleating lactose crystals 0.05-0.1% w.r.t. the weight of the whey. By this method, fine crystals of lactose are formed (10-15µ) and cheese having dense consistency is obtd.

Mineral feed additive for ruminants - contg. stable, readily assimilable sodium ammonium hydrogen phosphate
RANCHING RES INST 26.11.76-SU-424697
C03 E34 (17.07.78) A23k-01/17

$NaNH_4HPO_4$ is used as a mineral additive for ruminants' feed. It can be easily produced from phosphoric acid obtained by processing phosphate minerals, such as apatite or phosphorite. This cpd. is stable (in contrast to diammonium hydrogen phosphate previously used for this purpose and which evolves ammonia).

This white powder can be readily assimilated by ruminants Apart from the main components P, N and Na, it contains S, Mg, Fe, F, Al, etc. The powder or granules do not cake. The cost is relatively low.
Laskorin, B.N., Venediktov, A.M., Gopynko, Z.Sh. et al. Bul. 33/5.9.78. 26.11.76. as 424697 (2pp70)

CHAK/ ★ D13 48843B/26 ★US 4157-620
Bleached dried fruit prodn. in the field - using supporting frame and overlying plastics esp. vinyl film which filters out visible light rays
CHAKERIAN J P 10.04.78-US-895253
A97 Q76 (12.06.79) F26b-07

Dried and bleached fruit is produced by supporting fruit in a porous mass and passing SO_2 through the mass. A film of flexible, black plastics material which filters out visible light rays is placed over the mass and the latter is dried by exposure to solar radiation filtered by passage through the film. The film is minutely perforate to pass water vapour but the perforations are small enough to exclude rain water.

Used for prodn. of bleached raisins in the field. Relatively large yields are produced because losses due to insec-ts, rodents and other organisms are mininised. The operation can be effected totally in the field and grapes or other fruit do not have to be stored between method steps. The fruit dry more evenly and rapidly when covered by the black film than when exposed fully to solar radiation. The film permits the water vapour to escape and captures heat to facilitate drying of the grapes or other fruit. 10.4.78 as 895253 (5pp1044).

Drainage plates for cheese moulds - narrow slots formed by pressed out strips standing proud of surface not susceptible to clogging
WINCANTON ENGG LTD 04.04.75-GB-014001
*P13 (12.06.79) *BE-840-191 A01j-25/11 +A01j-11/06*

A perforated drainage plate for use as lining in a cheese mould has punched portions which form parallel strips dis-placed from the plane of the plate. The ends of the strips are integral with the plate and the centre portions form dra-inage slots. The major portions of the drainage plates cooperate with an external casing to form passages for drainage of whey pressed out of a block of cheese curd. The ends of the strips of each plate are inclined relative to the major portion of the plate at an angle of not more than 30°. The slots have a width which does not exceed 0.6mm. The strips each define a recessed surface having a radius of curvature which is not less than 1.0mm.

There is less change of fracture of the curd pillar and the curd does not become jammed in the recesses so that the slot size can be reduced to a min. 2.4.76 as 672954 (5pp1044).

Sodium saccharin purification - esp. removal of ortho-t
sulphonamide by countercurrent extraction with methylene c
CHIMICASA GMBH 02.08.76-LU-075518
*B02 E12 (12.06.79) *DT2730-861 C07d-275/06*

Saccharin sodium soluted in aq. soln. obtd. by the
cess of Fahlberg-Rensen, and which is contaminatec
with 5000 ppm of o-toluenesulphonamide, and which
tains 30-60wt.% by crystal wt. of saccharin sodium
fined.

Contaminated soln. is adjusted to pH 4.5-6.0 and
22°C. The o-toluenesulphonamide is extracted at 15
with methylene chloride passed vertically downwards
countercurrently to the soln., and soln. emulsified b
termittently passing them through flow baffle plates.
methylene chloride residues are evaporated from the
tracted aq. soln. The saccharin sodium is crystalli
from evaporated soln. The countercurrent extractio
continued until saccharin sodium crystallisable from
soln. has content < 1ppm o-toluene-sulphonamide.

Saccharin sodium prepd. has high purity level. P
cess can be performed economically and on an indust
scale. 27.7.77 as 819255 (3pp931).

TVTI- ★ D13 48953B/26 ★US 41
Meltable hard candy article - forms non-sticky glaze coati
confection without burning or scorching and has good shelf lif
TV TIME INC 12.01.78-US-868815
(12.06.79) A23g-03

A hard candy article comprises a precooked hard can
bar having a moisture content of 6 wt.% and a main b
section having planar upper and lower surfaces. A n
of spaced projections extend downwardly below the pl
of the lower surface and a skirt portion extends down
ly around the periphery of the bar.

The skirt and main body form an enclosure with th
bottom surface of a cooking vessel when placed in a v
for melting to form on cooling a brittle non-sticky gla
coating on a confection or food item. The enclosure
tains fluid and melted candy syrup beneath the main b
section when the bar is heated.

The bar can be rapidly melted down without burnin
scorching to form a crisp, non-sticky glaze coating on
article coated with the glaze. The bar has good packa
characteristics and shelf life. The bar can be formed
any conventional candy moulding appts. and the latera
wall surfaces of the bar are tapered slightly to facilita
rapid release of the bar from the mould. 12.1.78 as

odder mixing trailer with lateral discharge openings - fed by eparately controlled inclined conveyors and horizontal mixing crews

BAYERISCHE PFLUGFAB 16.12.77-DT-U38430

(27.06.79) B01f-15/02

A trailer for dispensing fodder along a path in a selected variable amnner comprises a steep sided storage container, including 2- 3 horizontal mixing screws, the lowermost screw used to convey the fodder towards a lateral discharage opening. The cross-section of the discharage opeing can be kept at a max area by use of aspring biassed slide. The slide can be closed by a hydraulically actuated cylinder.

The fodder is delivered through the opeing by a inclined conveyor driven if desired in responce to the drive of the mixing screws. Its path extends from beneath the lowermost mixing screw, extends through the discharge opeing and terminates in a discharge trough. There is one discharge opening on each side of the trailer, each of which has a separately controlled slide and discharge conveyor.

The trailer can mix and deposit apportioned amts. of fodder on both sides during one passage or in one direction of travel. 14.12.78 as 048545(6pp295)

Compact plant for activated sludge treatment of waste water - automatically increases aeration to respond to transient peak loads

SCHREIBER A 23.12.77-DT-757860

(22.06.79) C02c

The treament takes place successively in aeration, reaction and settling tanks with recycling of sludge from the settling tank. Part of the recycled, conc. sludge from the settling tank, part of the incoming waste water and a mixt. of waste water and sludge from the aeration tank are brought together in the reaction tank. The oxygen content of this mixt. in the reaction tank is measured and, if necessary, brought up to a required min. level and thoroughly agitated.

From the reaction tank, the mixt. is advanced to the aeration tank for intensive purificn. and then to settling tank. After concn. most settled sludge is returned to the reaction tank. A fraction of the sludge together with part of the incoming waste water is fed into the aeration tank. A vertical cylindrical reaction tank is pref. surrounded by a coaxial, annular, aeration tank.

Aeration of the reaction tank pref. takes place automatically as soon as the oxygen content of the liq. drops 0-0.2 mg/l. 22.12.78 as 872996 (17pp448)

Ammonia removal from sludge liquor - by raising pH to 9 by carb di:oxide removal, then purifying, then removing ammonia stripping with inert gas, pref. air
THAMES WATER AUTHOR 12.12.77-GB-051658
E35 (27.06.79) C01c-01/02 C02c-05/02
D/S: E(BE, CH, DT, FR, GB, LU, NL, SW).

Ammonia is removed from sludge liquor by raising the pH of the liquor, purifying it, and then contacting it with a gas which does not react with NH_3, so that the NH_3 is removed from the liquor into the gas. The improvemen comprises (i) raising the pH of the liquor to a value of a least 9 (pref. 9-12.5) by stripping CO_2 from it, and (ii) ensuring that the temp. of the purified liquor is at 5-50° prior to contacting it with the gas.

The process is used for removing NH_3 from sewages, sewage and industrial effluents, sludges and sewage sludge liquors and filtrates.

e process can achieve 95% ammonia removal and
recovery of this. Removal of $\geqslant$ 80% of the suspend-
ids, COD, BOD and phosphate from digested sludge
natant liquor has also been achieved.

DELALANDE C 27.09.77-FR-029060
J01 (25.05.79) B01d-03/14 B01d-53/20
he packing takes the form of a toroidal rosette in which
piral filaments are placed in a helix, relative to the
entre of the circular rosette. The facing sides of the fila-
ents have $\geqslant$ 1 projection at 90° to the surface of the
ide. Near the outer part of the rosette the filaments are
onnected to each other by a sinusoidal filament which also
as 90° projections from its sides.
The packing may be used in gas washers, absorption
nd desorption towers; in gas-liq. or liq. gas enriching
ystems; in dust traps; in chemical deodorisers; in cool-
ng towers; bacterial beds for water treatment; denitrific-
ation beds, catalysers etc.. The packing offers a high
efficiency and subsidence is practically eliminated. The
pressure loss across it is small. It is light and therefore
reducesthe encumbrance of the appts. 27.9.77 as 029060

Partial purificn. of effluents in station - is followed by biological
treatment with its own sludge in the outlet pipe
ALSTHOM-ATLANTIQUE 21.09.77-FR-028403
(25.05.79) C02c-01/06 C02c-05/04
Partial treatment of an effluent is effected in a biological
purificn. station which produces a sludge contg. suitable
microorganisms; the treatment is completed as the
effluent progresses along the outlet channel which may be
of a considerable length.
The effluent channel has an inlet at its upstream end
downstream end. A portion of the
the purificn. station. This delivers a treated effluent
through a pipe and a biological sludge contg. microorgan-
isms, produced by the sludge itself, through a further
pipe; it is injected into the liq. flowing through the outlet
channel and is discharged in the completely treated state.
The effluent may be treated in a comparatively small
station with all the resulting economies; the micro-org-
anisms produced from the effluent itself are partic. adap-
ted for the treatment. 21.9.77 as 028403 (5pp519).

Anion exchange resins with low chlorine content - prepd. by
solvolytic conversion of nonionic chlorine into chloride ion
ROHM & HAAS CO 13.06.75-US-586676
*A91 K05 (27.06.79) *NL7606-377 C08f-08*
A strong base anion exchange resin in hydroxy form and
free of chloride functional gps is prepd by (a) exchanging
chloride functional gps of a strong base anion exchange r
resin with functional gps of selectivity intermediate be-
tween chloride and hydroxy and (b) exchanging intermed-
iate selectivity gps with hydroxy gps by contacting the
resin with aq. (in)organic base.
In addn, the process comprises (i) before step (a) sub-
jecting the resin to solvolytic displacement of nonionic
chlorine to convert it to ionic chloride functionality by con-
tact with aq medium of pH $\geqslant$ 7 and/or (2) pretreating the
soln used in step (b) with ion exchange resin with high sel-
ectivity for chloride ions. Step (1) must take place if the
starting resin contains nonionic chlorine.
Absence of chloride gps makes the resin non-corrosive
and suitable for use in nuclear reactor systems. The star-
ting resin esp. has a polymer matrix derived from vinyl
benzyl chloride polymerisation. 2.6.76 as 022739(15pp945)

Treatment of heavy metal-contg. effluent - by adding iron cpd.,
making effluent alkaline, sepg. insol. magnetic matter and
recycling
ASAHI GLASS KK 21.10.77-JA-125812
J01 M11 (16.05.79) C02c-05/02
Heavy metal components are effectively and economically
removed from a heavy metals-contg. effluent, e.g. mix-
ing effluent, plating effluent and an effluent resulted in
washing smoke discharged from municipal dust-incinerat-
ing furnace, etc. using a small amt. of iron cpd. without
any heating of the effluent by adding iron salts e.g. $FeSO_4$,
etc. or aq. soln. thereof such that the concn. ratio be-
tween Fe(II) and Fe(III) ions become $^1/_3$-$^3/_1$ (1-1), adjusting
the pH value to >9 to form heavy metals-contg. insoluble
magnetic matter, sepg. the insoluble magnetic matter
from the effluent by solid-liq. sepn.
Process further comprises recycling the sepd. insolub-
le magnetic matter to the effluent maintained under pH >9,
so that the heavy metal components or the heavy metals-
contg. minute magnetic matter are deposited on the sur-
faces of the insoluble magnetic matter added (serving as
the nuclei) and simultaneously $Fe(OH)_2$ and $Fe(OH)_3$ are

also deposited thereon, thereby it becomes possible to form more stable insoluble cpds. from which the heavy metal components are hardly redissolved. 21.10.77 as 125812. (5pp34)

Treatment of heavy metals-contg. effluent - by adding blast furnace
slag, heating under agitation and treating with carbon di:oxide
NIPPON KOKAN KK 27.10.77-JA-128185
J01 M25 (19.05.79) C02c-05/02
Blast furnace slag is added to the effluent, followed by
heating under agitation to ppte. the heavy metal compon-
ents in the form of hydroxides, sulphides, silicates, and/-
or aluminates; CO_2 is blown into effluent at ordinary
temp. at pH >8, (>8.5) to ppte. Ca ion existing in the
effluent as the carbonate.
Simultaneously, water-soluble sulphur ion also existing
in the effluent is expelled off from the effluent in the form
of H_2S. 27.10.77 as 128185. (3pp34)

MITN ★ D15 48067B/26 ★ J5 4062-655
Dewatering organic sludge - by first adding an alkali substance, iron
salt and hydrogen peroxide prior to filtration
MITSUBISHI GAS CHEM IND 26.10.77-JA-128515
(19.05.79) C02c-03
The improvement comprises adding alkali matter, e.g.
NaOH, $Ca(OH)_2$, Na_2CO_3, CaO etc., to give a pH >9, an
iron salt, e.g. $FeCl_2$, $FeSO_4$, $FeCl_3$, $Fe_2(SO_4)_3$, etc. in
an amt. of 5-30wt.% of the solids content, and hydrogen
peroxide in amt. less than the equimol. amt. of the Fe
salt, pref. 0.4-0.9 mols. per mol. Fe salt, prior to filt-
ration.
Organic matter which is difficult to filter is decompos-
ed by oxidn. due to the hydroxyl radical resulting from the
reaction between hydrogen peroxide and ferrous or ferric
ion. The dewatering rate is increased with a decreased
amt. of filter cake generated. A Fe^{2+}-Fe^{3+} cpd. is form-
ed at pH >9, so that excellent coagulation strength is
obtd., giving flocs with excellent dewatering property.
The process is used for sludge from treatment of sewage,
human waste and industrial waste water. 26.10.77 as
128515. (3pp34)

Prodn. of complex membrane for reverse osmosis and ultrafiltration - by coating polymer bonding agent on sheet, forming pores, spirally winding on tubular membrane and compressing

NITTO ELECTRIC IND KK 28.10.77-JA-130145
A88 J01 (21.05.79) B01d-13

The membrane is obtd. by (a) coating a polymer type bonding agent on a sheet body, (b) forming pores through the sheet body thus coated to obtain a porous sheet, (c) winding the sheet on a tubular permeable membrane in spiral, (d) inserting a tube type supporter into the tube type membrane thus wound, and (e) compressing the porous sheet and membrane with (hot) water onto the supporter to obtain a complex type permeable membrane.

Specifically, a porous sheet of polyethylene coated with a vinyl acetate system bonding agent is wound on a tube type semipermeable membrane of cellulose acetate to obtain a tube type complex membrane. The complex membrane is inserted in a tube type supporter. The complex membrane is pressed with water onto the inner side of the supporting tube to be completely bonded between the sheet and the semipermeable membrane. 28.10.77 as 130145. (6pp51)

NITL ★ D15 48119B/26 ★J5 4062-983

Tubular semipermeable membrane prodn. - includes coating sheet with polymeric bonding agent, forming pores in the sheet and winding sheet on semipermeable tube

NITTO ELECTRIC IND KK 28.10.77-JA-130146
A88 J01 (21.05.79) B01d-13

The membrane is obtd. by (a) coating a polymeric bonding agent onto a sheet, (b) forming pores through the coated sheet; (c) winding the porous sheet on a semipermeable tube to obtain a tubular composite membrane; (d) inserting the composite membrane into a porous supporting tube and (e) pressing the membrane with pressurised water or hot water onto the supporting tube.

Typically, a porous polyethylene film coated with vinyl acetate system bonding agent is wound on a semipermeable tube of acetyl cellulose to obtain a composite membrane. The membrane is inserted into a porous supporting tube and pressed with compressed water onto the supporting tube. A completely bonded permeable membrane is thus obtd.

The membrane is used in reverse osmosis or ultrafiltration. 28.10.77 as 130146. (6pp51)

Livestock manure disinfection system - uses electro-osmosis to
remove liquid prior to aerobic processing
SIBE AGRIC ACAD 29.03.77-SU-475442
P11 (18.07.78) A01c-03

A livestock manure disinfection, for use with manure in a
tank beneath a livestock building involves aerobic treat-
ment of the manure. The system is designed to give a
more intense process by reducing the moisture content
of the manure to 60-75% by electro-osmosis prior to
aerobic processing. Electric current is passed through
the manure via anodes, causing the liquid part of the
manure to travel towards the cathode, made in the form
of a perforated pipe, through which it is removed to an
irrigation network.

The passage of the electrical current speeds up the
process of the subsequent aerobic treatment and intensi-
fies disinfection.

UKR WATER ENGGS INS 09.03.77-SU-460835
J01 P41 (25.07.78) B03d-01/14 C02c-01/26

The separator is as per Parent Certificate No. 545589 but
to improve efficiency of cleaning by preventing settling
particles being carried out with the cleaned water, it has
inverted truncated cones set concentrically to the cleaned
water removal system. The light suspension, under the
effect of the bubbles of air attached, rises and is directed
by the baffles into the sludge accumulator, where it con-
tinues to rise and is removed by scraper through the
collection trough and out via the outlet tube. The heavy
particles settle and are directed to the bottom by the
baffles, then out via an outlet tube. The cleaned water,
with the settling particles, goes into the bottom, where
the water is sepd. in the laminar space formed by the
concentric cones, and is removed.

Inverted vessel for converting organic waste to combustible gas - with open bottom disposed in body of water which removes waste products
CHOW B H 17.03.78-US-887780
C04 E17 H09 (12.06.79) C02c-01/14

Appts. for converting organic waste materials to conbustible gases comprises a vessel positioned in a body of water having an inlet for addition of organic matter and an open bottom. A perforated pipe is located in the lower portion of the vessel which is connected to a pressurised source of water. An outlet positioned at the top of the vessel permits removal of combustible gas generated in the vessel and is connected to a storage tank. The collected gas is washed to remove non-combustibles.

Used for mfr. of conbustible gas, principally methane, from organic wastes, such as grass cuttings, leaves and sewage sludge. The appts. can operate at a temp. as low as 21°C. Gas can be produced continuously and the operation is self-cleaning. The internal pressure is automatically regulated and the appts. is leakproof. A moving current of water agitates the organic material and sweeps the waste products from the vessel bottom for recovery, e.g for use as fertiliser. Approx. 11 cu. ft. gas per lb. organic waste can be produced. 17.3.78 as 887780 (4pp1044).

HUANG J Y C 18.11.77-US-852626
J01 (12.06.79) B01d-23/24

Appts. for filtering suspended solid matter from a flui
-cludes a filter bed contg. particulate filter media hav
ing an average particle size large enough to cause floc
ation of the solid matter in the bed when the fluid has b
treated with coagulant. A pipe extends vertically thro
the filter media and includes at least one inlet part in
vicinity of the top surface of the media capable of rece
ing relatively dense accumulations of solid matter and
solid particulate and flocculated material on the media
carried to the top surface. At least one outlet part re
ns the solid matter to the filter bed after it has been
comminuted.

Used in flocculation/filtration system with backwash
cycle. The backwash cycle is performed through the c
ed-circuit. Use of clarified water is made which scou
and cleans the filter media and breaks up mudballs. T
water is then purified and made ready for another clea
ing cycle. The backwash volume including a final polis
ng step utilises < 2% of the filtered water vol. The re
-ed flocculation period is greatly reduced. The filter
accept higher suspended solid concns. in the fluid load
on the filter. 18.11.77 as 852626 (7pp1044).

Settling tank for oil-sepn. - having large length to height ratio
transverse baffles to create piston-like displacement of mixture
TEXACO INC 29.12.77-US-865543
J01 (12.06.79) B01d-17/04

A setting tank for oil and water mixtures comprises an
elongated tank having an inlet located near the top of the
side wall at one end and an outlet located near the botto
the side wall at the other end. A second outlet for oil
is located at a level above the inlet. Baffles in the tank
avoid channeling of the mixture and include parallel tra
verse panels which have patterns of apertures. The tan
has a length to wall height ratio of about 25 and the wall
height is about 4 feet.

The baffles create a piston-like displacement of the
-ture as it moves from the inlet to the outlet end. The
wall height is short enough to miminize the vertical mig
-tion distance of mixture oil particles. Alternative one
of the panels have apertures for restricting fluid flow n
the centre than near the ends and the remainder have apertures for restricting fluid flow near the ends more th
the centres. The panels may be removable to permit s
and silt removal without shut down of the tank operation.
The increased length of the tank increases the residenc
time of the fluids in the tank. 29.12.77 as 865543 (6pp1

Higher fatty acid ester(s) of cellulosic fibrous derivs. - used as carrier having high lipase adsorption

TOYO BREWING KK 00.00.78-JA-080706 (12.09.72-JA-092001)

A11 B04 (A97) (15.05.79) C08b-15

The process comprises carboxymethylating, phosphating, sulphomethylating, sulphoethylating, p-aminobenzylating, aminoethylating, diethylaminoethylating, triethylaminoethylating or guanidinoethylating cellulosic fibre and treating resulting cellulosic deriv. with a fatty acid halide in the presence of a base.

In an example, 5 g. of cotton gauze is fed in 20 ml. of 10N aq. NaOH and the mixt. is cooled for 30 mins. in ice bath under agitation. The mixt. is then admixed with 3 g. of monochloroacetic acid dissolved in 5 ml. of water and reacted at 70°C for 20 mins. The reaction mixt. is cooled in ice bath, added with 50 ml. of 10% acetic acid, and diluted with 200 ml. of water. The insolubles are sepd., rinsed with water several times, added with 1 ml. of glacial acetic acid and rinsed with water until showing of no acidic pH of the washings. The insolubles are then washed with ethanol and dried to give carboxymethylated cotton gauze.

In a soln. of 10 g. of palmitic chloride in 40 ml. of pyridine, 3 g. of the carboxymethylated gauze is suspended and reacted at 30°C for 15 hrs. under agitation. Then the reaction mixt. is admixed with 100 ml. of chloroform, then with 100 ml. of ethanol to collect the pptd. solids, which are then washed with 200 ml. of chloroform/ethanol (1:1) and then with 100 ml. of ethanol. After drying palmitate ester powder of CM-Ce is obtd. in a yield of 3.2 g.

The process can provide a novel carrier having high adsorptive power for lipase which can separate, purify, etc., lipase conveniently. 12.9.72 as 80706/78, Div. ex 92001/72. (4pp59)

Decolourising 'seishu' produced by rice fermentation - by contacting with chelating ion exchange resin and active carbon

UNITIKA KK 21.10.77-JA-126997

(19.05.79) C12h-01/04

A method for decolourisation of "Seishu" (I), involves bringing (I) in contact with chelating ion exchange resin (II) and active carbon. "Seishu" is a Japanese liquor produced by fermentation of rice. In (I), many kinds of colouring cpds., such as flavin, ferrichrysin, melanoidine, caramel etc., are contained. Heavy metals, such as manganese, copper, zinc, etc., are also contained in (I) and they act a as catalyst for the colouring reaction with light irradiation. By the present method, (I) can be deodourised almost completely.

Examples of (II) are as follows: (1) mixt. of (II) having hydrogen at terminal of functional gps. (III) and (II) having alkali metal at terminal of (III); (2) mixt. of (II) having hydrogen at terminal of (III) and (II) having alkali earth metal at terminal of (III); and (3) (II) having aluminium at terminal of (III). 21.10.77 as 126997. Photoreducible or nutrient Chlorella or Cenedesmus cultivation - in medium contg. slime bacteria e.g. Bacillus microorganisms

SEKINE K 20.09.68-JA-068079
(05.06.79) C12b-03/12

Slime bacteria is cultivated in a medium contg. organic substance, the slime bacteria is removed the viscosity is adjusted and then in thus obtd. medium is cultivated photoreducible or nutrient chlorella or cenedesmus, whereby a large amt. of chlorella or cenedesmus can be obtd.

The slime bacteria includes microorganism belonging to the genus Chondromyces, Mixococus, Sporocytophage, Bacillus, Aerobacter, Leuconostoc, and the like. The organic substance includes potato, wasted molasses, etc. The cultivation is conducted at 20-30°C under aerobic conditions for 7-15 days. The cultivation of chlorella or cenedesmus is conducted under aerobic conditions at 27-37°C for 3-4 days at concn. of chlorella, etc. of 1/5 to 1/10 of the culture medium. The prod. can be obtd. in high yield. 20.9.68 as 068079, C12b-3/1 (5.6.79) SEKINE K (3pp22)

Enzymatic prodn. of d-tartaric acid - from cis-epoxy-succinic acid using e.g. Achromobacter tartarogenes

TORAY INDS INC 30.04.74-JA-047526
*E17 (05.06.79) *J50140-684 +C12d-01/02*

d-Tartaric acid (I) was produced from cis-epoxy-succinic acid (II) by reaction of I-epoxydase. In an example Achromobacter tartarogenes (FERM-P 2508) was cultured with shaking at 26° for 40 hrs. on 3 l. medium (pH 7.2) contg. Na-II 0.5, $(NH_4)_2SO_4$ 0.2, KH_2PO_4 0.14, $Na_2HPO_4 12H_2O$ 0.31, $MgSO_4 \cdot 7H_2O$ 0.05 and yeast extract 0.02%. The cells were suspended in 200 ml. of 0.01 M Tris-HCl buffer (pH 7.6). The suspension (100 ml) was subjected to French Press and then sonicated.

The enzyme was obtd. from the supernatant by $(NH_4)_2SO_4$ fractionation and dissolved in 46 ml of 0.01 M Tris-HCl buffer (pH 7.6) and dialysed against the same buffer overnight. Reaction mixt. (50 ml) contg. the enzyme soln. (13.2 mg protein/ml. 167 units), water 33, and 20% Na-II 50 ml was rafted at 40° for 24 hrs. To the mixt. 14 ml. of 4.5 M $CaCl_2$ was added to ppt. Ca-I, The Ca-I was washed with water and suspended in a small amt. of water, added with 150 ml. Amberlite IR 120 B(H^+), stirred at room temp. until the soln. became transparent. The filtrate was conc. to dryness, added with ~ 50 ml. of 99.5% EtOH, and evapd. after the insol. substances were removed. I was obtd. at 7.77g with 91.2% yield, 30.4.74 as 047526, C12d-1/02 (5.6.79) TORAY INDS. INC. (9pp) (J5 0140684)

In the continuous processing of sugar molasses by pptn. the sugar in the molasses cooled to $<$15°C by means of lime, with formation of Ca saccharate, the molasses is first diluted with water and/or the filtrate from the Ca saccharate ppte. and 1 vol. of the dil. molasses is mixe with 3-7 vols. of recycled lime-treated molasses in whi a Ca saccharate ppte. has already formed. The lime is fed in countercurrent to the molasses feed and is forced back by stirring in the direction of the feed position of t recycled, lime-treated molasses, so that an alkali grad ent arises in the vessel from the lime feed position to th feed position of the recycled, lime-treated molasses. Pptn. takes place in 1 treatment phase.

The appts. is simpler and the end prod. is obtd. in better yield and better quality. The process is less affe ed by the quality and the fineness of the lime powder, an the dilution of the initial molasses. Pptn. is more uniform and the pptd. particles are larger; filtration is therefore more rapid. Less lime is needed. The ratio by vol. of dil. molasses:lime-treated molasses is pref. 1:4-5. The amt. of lime is 70-130 (100-130) g./100 g. of sucrose in the molasses. Unslaked lime may be partly (50-60%) replaced by milk of lime. 4.7.70 as 009938. (9pp510)

Tobacco leaf inspection - for cigar wrapper
AMF INC 04.09.70-US-069601
*P15 (21.06.79) *GB1323-236 A24c-01/04*

A machine for the automatic check of a tobacco leaf for suitability as a wrapper for cigars consists of a recess along the wall of a vacuum chamber, which corresponds to the contour of a punched wrapper leaf. The recess is subdivided into several (five) sections by cross partitions and each section is connected by a hole to the vacuum chamber.

Pressure-sensitive pickups are connected to each section to measure the pressure in them when a tobacco leaf is applied across the whole recess. This indicates clearly which part of the leaf contains holes or pores to make it unfit for use as a cigar wrapper. 27.8.71 as 143089(9pp)

Leather brushing machine - with gap between work plate and brushing roll adjustable by power cylinder
WURTT PELZMASCH POH 17.12.77-DT-756425
(21.06.79) C14b-01/52

A brushing machine for the treatment of leather, specially the leather side of hides, includes a horizontal roll with brushes arranged in the longitudinal direction. A hinged workplate below and parallel to this roll can be moved by power cylinder to exert an adjustable pressure and to orm an adjustable intake and treatment gap.

This imparts to hides (sheep skins) a velour-like finish on the leather side. It improves the pliability and the surface grip and gives the surface a velvety appearance. 17.12.77 as 756425 (12pp39)

A creamy or emulsive cosmetic (I), comprises pectin (II), oily cpd. (III) and water (IV). (I) is highly safe, has high affinity to skin, high stability against change in quality and high emulsion-stability. In the prepn., (II) and (IV) are heated under agitation, and then the mixt. is emulsified under vigorous agitation after addn. of (III).

The contents of (II), (III) and (IV) are 0.05-20wt.%, 5-90wt.% and 10-90wt.%, respectively. (II) has pref. an average molecular wt. 10,000-1,000,000 and methyl esterification degree 5-95%. Examples of (III) are hydrocarbon, such as liq. paraffin, squalane, etc., animal fat, such as wheal oil (sic), tallow, etc., vegetable oil, such as castor oil, palm oil, etc., wax, such as lanolin, carnauba wax, etc., high molecular alcohol, high molecular fatty acid and/or ester oil. 27.10.77 as 129315. SHIS ★ D21 48186B/26 ★ J5 4063-132

Red pigment complex for use in cosmetic compsns. - obtd. by reacting rhodamine B and an ionic dye on clay mineral material

SHISEIDO KK 31.10.77-JA-130465

E23 (E24) (21.05.79) C09c-03/08

Prodn. of red colouring pigments comprises adsorbing a complex obtd. by reacting Rhodamine B (cationic dye) and an anionic dye on clay mineral material. Rhodamine B has excellent colour power, light resistance, bright tone and a wide colour range but colours the skin, and so cannot be used in cosmetics. By making a complex and subsequent adsorption, the skin colouring nature is eliminated, and the prod. is useful in cosmetics.

The reaction of Rhodamine and an anionic dye in aq. medium proceeds as follows: $D_1\text{-}SO_3Na + D_2{=}N(C_2H_5){+}_2\ Cl^- \longrightarrow D_1\text{-}SO_3(C_2H_5)_2N{=}D_2$ where D_1 and D_2 are dye residue. When the anionic dye has one sulphonic gp., the 1:1 complex is formed, and when two sulphonic gps., 1:1 and 1:2 complexes are formed. The formation of the complex is determined by specific conductivity method, capillary method etc. The adsorption of the complex on clay mineral is determined by X-ray diffractometry. For example, the pigment is made by mixing solns. each contg. equimolar Rhodamine B and an anionic dye to form a complex, adding clay mineral (bentonite etc.) with stirring, treating with a chloride of Ca, Ba or Al, stirring at 50°C for ca. an hour to ppte. a pigment, filtering it, hot washing, drying and crushing. 31.10.77 as 130465. (7pp119)

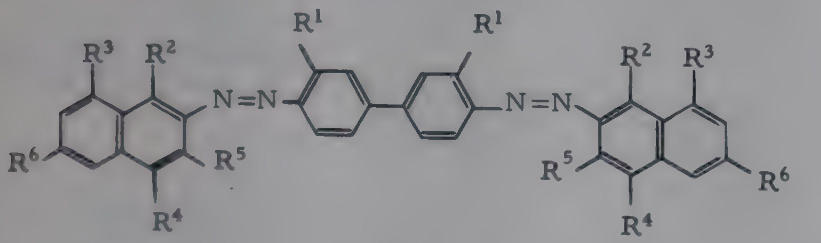
PVA compsn. for use as base material for deodorant gels - contains saponified PVA and diazo cpd. and/or phenol (cpd)

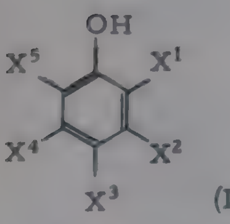
SHINETSU CHEM IND KK 31.10.77-JA-130585

A14 E21 (A97) (21.05.79) A61k-07/46 C08k-05/13 C08l-29/04

The compsn. comprises (1) PVA of saponification degree 80-100% and (2) a diazo cpd. of formula (I) and/or a phenol of formula (II).



(I)



(II)

In (I), R^1 is H, methyl or methoxy; R^2 is amino or OH; R^3 is H or amino; R^4 and R^5 are H or $-SO_3Na$; R^6 is H, amino or $-SO_3Na$, providing that R^3 and R^6 are amino or $-SO_3Na$ when R^4 is H. In (II), X^1, X^2, X^4 and X^5 are H or OH; X^3 is H, OH, or COOH.

Compsns. are used as water-contg. gels for deodorant base material. (I) includes Congo Red, C.I. Direct Red 28, Congo Corinth, C.I. Direct Red 10, etc. (II) includes catechol, resorcin, hydroquinone, etc.

In an example, a gel deodorant was prepd. by mixing, at 60°C for 10 mins., PVA (saponification degree 98.8%, polymerisation degree 1760) 100, Congo Red 0.8, ethylene glycol 1.0, and rose aroma, followed by gelation at 5°C for 4 hrs. in a refrigerator. A red flexible gel of good appearance was obtd. 31.10.77 as 130585. (5pp128)

Nail varnish based on aq. polymer emulsion - gives rapid drying film of good moisture permeability

ELI LILLY & CO 05.08.77-US-822040

*A96 G02 (A14 A82) (12.06.79) *BE-861-728 A61k-07/04*

Nail coating formulation is prepd. which upon drying form a film which will adhere to keratin of the nail, and has moisture vapour transmission of 0.1-1.6 $mg/cm^2/hr$.

Formulation comprises an aq. emulsion polymer with solids content of 30-55%. Polymer has a Tg of -10 - +50 °C when measured by differential thermal analysis. Prep is by an aq. emulsion polymerisation of $\geqslant$2 monomers of formula $CH_2{=}CHCOOR$, $CH_2{=}C(CH_3)COOR$ and/or $R^1C(PhR^2){=}CHR^1$, where R is 1-20C alkyl, Ph, benzyl, hydroxy- or 1-4C alkoxy- (1-4C) alkyl, cyclopentyl, cyclohexyl, furyl, 1-4C alkylfuryl or (1-4C alkyl) tetrahydrofuryl. R^1 is H or Me, R^2 is H or 1-3C alkyl. When R in one monomer is 1-4C alkoxy- (1-4C) alkyl, the R in the other monomer is not 1-4C alkoxy- or hydroxy (1-4C) alkyl.

Formulation has improved properties of reduced occlu-
, faster drying time, non-yellowing of the nail and a
-flammable solvent. 5.8.77 as 822040 (11pp931).

**a whitlockite prepn. in solid or porous form - by direct reaction in
sence of excess calcium, drying, and sintering, for use in
sthesis**
STERLING DRUG INC 23.12.77-US-863721
L02 P32 (20.06.79) A61f C04b

anslucent, isotropic, essentially pore-free polycrystal-
ceramic consists of whitlockite contg. 0.1-2.2 wt.%
lphate ions in its crystal lattice, and has an average
ain size of 0.3-3 μ and a density ⩾98% of the theoreti-
l value for β-whitlockite.

Also claimed is an expanded polycrystalline ceramic
dy of the same compsn. and grain size but with a total
re volume of 20-80%. The ceramic bodies may be in the
rm of flat sheet, round rod, or resorbable osseous arti-
cial prosthesis.

Esp. as bone replacements for orthopaedics. It can be
sed for complete or partial replacement. Since it is re-
orbed slowly, it is replaced slowly by hard new biologi-
al tissue. The non-porous material exhibits high com-
ressive strength (6300-9100 kg/cm^2) and tensile strength
700-2100 kg/cm^2) and higher according to the shape and
ize of the body. 20.12.78 as 872887 (23pp396)

**travaginal period sanitary tampon with extraction cord - which is
oped into absorbent material to prevent tampon distortion during
xtraction**
MOLNLYCKE AB 21.12.77-SW-014598
P32 (20.06.79) A61f

An intravaginal, periodic, sanitary tampon comprises a
multilayer pad of absorbent material rolled as a cylinder,
and an attached extractor cord extending from one end of
the tampon.

The cord is now laid right through the layers to form at least two loops with strands extending around opposite longitudinal ends of at least two absorbent layers. The loose ends of the cord pref. project from the centre of the layers so that they eventually hang axially from the cylindrical tampon. The absorbent layers are pref. enclosed in waterproof plastic cover sheet.

The cord location ensures that the tampon does not suffer distortion when the cord is pulled for extraction, so that removal is clean and easy. 20.12.78 as 872890 (14pp448)

**Determination of number of particles in air - using electrostatic fie
with deflection through 180 degrees for use with microbiologic
counts in pharmaceutical works etc.**

BECK C 16.12.77-DT-756164

J04 R16 (21.06.79) G01n-01/22 G01n-15/06

The number of dust particles in air is used to determine
air purity. The number is measured by deflecting the ai

on.

Below this is mounted an electrode immediately above is is placed a droplet of a tacky liq. to collect the dust on glass slide. Because of the electric field, the particles come charged and are attracted to the electrode located mmediately below the droplet. They enter the boundary yer and then remain. Their number is counted by a conentional microscopic technique.

Used in measuring air purity in pharmaceutical works, spenseries etc. esp. to measure microbiological counts. llows this to be done simply and cheaply using appts. ommonly available in medical or pharmaceutical areas nd in equipment which is easily operated. 16.12.77 as 56164 (24pp1053)

NIRA ★ D22 47963B/26 ★J5 4062-175

Device for treating gas contg. noxious gases, solvents, etc. - contains high surface area, fibrous active carbon obtd. by carbonising, e.g. acrylonitrile polymer fibre

UNITIKA KK 27.10.77-JA-129408

A35 J01 (18.05.79) B01d-53/06

The fibrous active carbon is made of synthetic fibre such as rayon, acrylonitrile, vinylon, polyvinyl chloride etc., which is carbided at 400-1200°C. A column is partitioned by walls impermeable to the gas, into cells, each having a sector cross-section. The carbided polymer sheet is folded into a V-shape profile as seen from the side of the column and packed in each cell.

This increases the surface area of the active carbon packed in the column such as cylindrical column having a gas inlet and outlet for passing the gas through the packed carbon. 27.10.77 as 129408. (3pp26)

KURS ★ D22 48142B/26 ★J5 4063-025

ndustrial plant to dry and cool processed sunflower seeds, etc. - ses atmospheric air in fluidised bed exhausting via predryer

VEB SCHWERMASCH THALMANN 24.02.78-SU-587461

(D14) (18.06.79) A23n C11b

A plant installation for drying and cooling vegetable oil-producing seed, partic. ground sunflower seed, after the seed has been subjected to a heating/wetting process, is of the type in which seed is dropped through a predrying chamber and from there to an air-fluidised, circular bed in the base of an upwardly divergent cyclone. Cyclone air is exhausted via the predrying chamber. The fluidised bed conveys the prod. over an annular, horizontal path and then drops it into a discharge screw conveyor.

The predrying chamber now contains adjustable, slatted screens, i.e. 'venetian' type, by which the angle of air flow w.r.t. prod. flow can be regulated, e.g. between 0-90°. Inside the cyclone, an upwardly convergent cone leads exhaust air towards the predryer connection which has helical slots back into the convergent cone. The fluidised bed air chest has a downwardly convergent cone connected into the top of the discharge screw conveyor.

This dryer/cooler is also for oatmeal, pearl barley, etc. The single, much more compact plant can process 500 tonnes in 24 hrs., compared with 200 tonnes from earlier, larger installations. Prod. quality is enhanced by much more homogeneous treatment. Atmos. air used as the cooling/drying medium is filtered through incoming seed in the predryer. This cleans the exhaust and raises prod. yield by eliminating loss of fines. 22.2.79 as 874363 (13pp448)

(19.05.79) C11b-03/02 C11c-03/12

Before decolourisation and deodourisation, palm oil is hydrogenated using a Ni catalyst carried by graphite. R fined palm oil having favourable colour tone, high resis tance to rancidification and low revivability to its origin odour is obtd.

Carotinoid colouring matter in palm oil is converted effectively by the hydrogenation of palm oil using 0.03-0 wt.% of Ni catalyst which is carried by graphite before i is decoloured and deodourised at 180-220°C under 1-5 kg cm^2 of hydrogen pressure, (i.e., content of remaining β carotine is reduced to < 10 ppm). In an example, a mix of Ni and graphite (i.e., content of Ni is desirable to be 18-25wt.%) is chlorinated by chlorine gas, then it is reduced using reducing agent, (e.g., hydrogen, Li-Al hydride, sodium borohydride, metallic sodium). 28.10.77 as 129301. 2-Hydroxy-7-alkyl-bi:cyclo(2.2.1)heptane(s) prodn. - for use aromatising components for perfumes, by reducing 7-alk nor:camphane
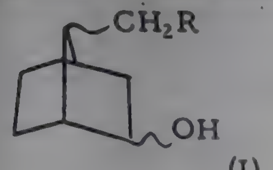
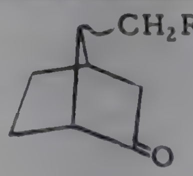
SAGAMI CHEM RES CENTRE 28.10.77-JA-128723
E15 (21.05.79) A61k-07/46 C07c-35/28 C11b-09

2-Hydroxy-7-alkylbicyclo[2.2.1]heptanes of formula (I) (where R is 2-7C alkyl) are prepd. by reducing the corre ponding 7-alkylnorcamphane of formula (II).

Specifically



(I)



(II)

(II) are produced by condensing cyclopentadiene with inexpensive aldehydes, and clisation-adding 2-chloroacrylonitrile to the fulvenes erived above, catalytically hydrogenating and saponifying e adducts. (I) have a flower-like aroma. They are sed as the aromatising matters for soaps, detergents, erfume, etc. (I) are stable to O_2, sunshine, temp. and umidity, partic. to acids and alkalis. They do not irritte the skin. 28.10.77 as 128723. (6pp136)

Fluidity of fats and oils - is improved by maintaining temp. of fused oils between m. pt. and solidification point and stirring

NISSHIN OIL MILLS KK 25.11.76-JA-140735

*(31.05.79) *J53065-308 C11b-03/16*

Fluidity improvement of fats and oils comprises maintaining for cooling the fats and oils fused by heating at a temp. between m. pt. and a solidifying pt. where adequate stirring is effected to allow crystals to deposit and disperse adequately.

The fused fats and oils are maintained at a temp. for a period of > 6 hrs. Process improves the fluidity of fats

solid or less fluid at ambient temp. e.g. palm oils, cotton seed stearin, and hydrogenated oils and fats, to such an extent that they may be pumped. Process requires simple procedures, being run at reduced costs, and produces no by-prod. and not adding any additives or liq. oils maintains the compsn. of the original oils, thus retaining well the good oxidn. stability.

The process, probably changing the peritectic situations under the specified conditions, improves the fluidity, opening new applications for the fats and oils being solid or less fluid at room temp. 25.11.76 as 140735, C11b-3/16 (31.5.79) NISSHIN OIL MILLS KK (3pp) (J5 3065308)

D24: SOAP; SOAP DETERGENTS

UNIL D24 61193R/34 =DS 2007-557

Superfatted toilet soap comprising a soap and - detergent which is not of the soap class

UNILEVER NV 20.02.69-GB-009220
*E17 (D25) (21.06.79) *BE-746-329 +C11d-01/37*

Toilet soap comprises a mixt.of an alkali sulphate of a primary alcohol (I) and free fatty acid. 10-75% of alcohol (I) has the formula $CH_3(CH_2)_nCHR-CH_2OH$ (where n = 7-14; R = 1-4C aliphatic gp. and total number of C atoms = 11-18). The rest of the alcohol present is unbranched and of similar carbon number. When the alkali sulphate content ⩽ 30% (based on wt of sulphate + soap) the potassium ion content is 20-85 wt.% of the sulphate. When the alkali sulphate content > 30% the potassium ion content is 6-25.5%

The soap produces a large amt. of creamy foam when the K ion content lies between the specified limits. 19.2.70 as 007557(5pp68)

UNIL D24 61193R/34 =NL -160-610

Superfatted toilet soap comprising a soap and - detergent which is not of the soap class

UNILEVER NV 20.02.69-GB-009220
*E17 (D25) (15.06.79) *BE-746-329 +C11d-09/48 C11d-10/04*

A piece of superfatted toilet soap is prepd. by forming a mixt. of an alkali metal soap, a free fatty acid and an alkali metal alkyl sulphate mixt. in which 10-75 moles-% has the formula $CH_3-(CH_2)_n-CH(R)-CH_2-OSO_3M$, where M is Na or K; n = 7-14; R is a 1-4C aliphatic residue and the total number of C atoms is 11-18, and the rest consists of unbranched alkyl sulphates with the same number of C atoms, followed by forming the mixt. into a piece of soap.

The alkali metal soap and/or alkyl sulphate mixts. consist partly of K salts, such that the amt., calculated as K alkyl sulphate, is (a) 20-85wt.% of the alkali metal alkyl sulphates if the piece of soap contains ⋟30wt.% alkali metal alkyl sulphates, or (b) 6-25.5wt.% of the total am of soap and alkali metal alkyl sulphates if the piece of soap contains > 30wt.% alkali metal alkyl sulphates.

The toilet soap has better foam properties, as regar both vol. and creaminess of the foam, an acceptable rat of wear, and a pleasant feel. The soap is pref. derived from an 8-24C monocarboxylic acid (mixt.). The free acid is esp. the same as the acid from which the soap is derived; the amt. is ⋟15(4-10)wt.%. The alkyl sulpha is partic. derived from a 12-15C alcohol in which R is CH_3. 16.2.70 as 002120. (6pp510)

ising Na_2CO_3-contg. crystals from the second stream in
the presence of recycled mother liquor and (d) separatel
processing crystals from each stream to produce soda a
prods. of different purity.

The prod. from (b) has high purity and is useful for N
silicate or detergent mfr. The prod. from (c) allows hi
-er yields to be obtd. through recycling of mother liquor
and is of a suitable density for glass mfr. 18.1.78 as
870580 (7pp091).

CPI INDEXES

LERTING PATENTEE INDEX (II)

ekly by section and overall, lists all current patents in entee code order and, within a given patentee, in earliest ority date order. The first line gives patentee code, liest priority date, patentee name, CPI classes and finally current patent number. The second line gives the first t of the title, followed by the accession number.

```

Not in Basic Abstracts Journal

PI CLASS INDEX (IV)

eekly only. Headings are all the CPI asses within the section to which an erting Bulletin relates, arranged in umerical order. Posted under each class eading is a list, in country then patent umber order, of all basic or equivalent ocuments referenced or cross-eferenced under that heading.

BASIC NUMBER INDEX (V)

Veekly by section and overall, lists all ntries by accession number. Each eading consists of the accession umber in bold, followed by the CPI ection letters. There then follows a st of all the family members, ommencing with the basic and inishing with the current week's atent. For each family member the CPI week of issue is quoted, and a lus sign indicates that a multiple riority has been claimed.

BASIC PATENTEE INDEX (X)

Weekly by section in BAJ only. Entries under any given patentee code heading are in earliest priority date order. The title, truncated to 105 characters, is followed by the accession number and current patent number. The last line of each entry consists of the patentee name, the priority details (earliest then latest if there is more than one) and finally the Derwent classes. This index is cumulated quarterly and annually by section as hard copy. Overall A—M cumulations of from a quarter up to 5 years are available as COM.

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

APPENDIX I

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180	
Europe	150	
France	740	
Germany, W. unexamined	1050	
Japan unexamined	845*	
Netherlands unexamined	240	
PCT	40	
Research Disclosure	20	
South Africa	100	
Sweden	260	
United Kingdom unexamined	600	3325

Slow publishing

Canada	450	
Germany, E.	100	
Germany, W. examined	465	
Japan examined	340*	
Netherlands examined	60	
Soviet Union	1200	
Switzerland	260	
United Kingdom examined	300	
United States	1200	4375

*Only CPI coverage for Japan.

"Minor" Countries

Complete coverage, but only introduced during 1975, with exception of Italy 1978.

Fast publishing

Brazil	140	
Denmark	120	
Finland	60	
Norway	80	
Portugal	30	430

Slow publishing

Austria	125	
Czechoslvakia	180	
Hungary	35	
Israel	40	
Italy	155	
Rumania	25	560

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguishe accepted West German specifications (DAS) from th unexamined applications (OLS) which are given the norma DT code. in the case of Japan J5 represents th unexamined applications, and J7 the examined of th present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry	F	Textiles, Paper, Cellulose
A+	Polymer Applns.	G	Printing, Coating, Photographic Chemistry
AE	Polymer & General Chemistry		
B	Pharmaceuticals	H	Petroleum
C	Agricultural Chemistry	J	Chemical Engineering
D	Food, Disinfectants, Detergents	K	Nucleonics, Explosives, Protection
E	General Chemistry	L	Refractories, Ceramics
E+	General Chemistry Applns.	M	Metallurgy

Typical Abstract Heading

See CPI/WPI Instruction Manual No. 1A for explanation of the various flagged descriptors.

D1: FOOD; FERMENTATION

D11 : BAKING

HN/ ★ D11 49079B/27 ★DL-134-910
serving baker's wares - by admixing dough with paste contg.
ulsifier esp. di:acetyl tartrate, saccharose, glucose and baking

SCHNEEWEISS R 17.03.78-DL-204264
(04.04.79) A21d-02/08

ker's wares, esp. small wheat baker's wares, with add- fat and sugar, are kept fresh longer by admixing the ugh with 1-3% compsn. prepd. by (a) mixing an emulsifier p. diacetyl tartrate, with saccharose, glucose and baking t, heated to 40°C, and (b) working to a paste contg. 15- % emulsifier, 30% baking fat, 30-40% saccharose and -20% glucose.

Prods. are completely fresh 9 hrs. after baking. Baking l. is increased by up to 10%. Crumb softness and loose- ess, pore uniformity and browning are improved. 17.3.78 s 204264 (9pp200)

AUL/ D11 74430Y/42 =DS 2759-302
otary oven for heating prepd. pizzas - has helical path and coaxial otor to propel and rotate pizzas

PAULUCCI J F 02.04.76-US-672849
*+P28 (28.06.79) *DT2714-761 A21b-03*

Pizzas are baked in a high temp. oven in hot air. The oven consists of a vertical cylindrical chamber in which a spiral bed is mounted with an outer lip to guide the movement of the pizzas down the bed. A central shaft rotates and causes the pizzas to be rotated and descend the spiral. The pizzas are fed into the top of the oven in baking forms and are removed at the bottom via a radial chute.

The construction is such that the pizzas cause no disruption of the drive mechanism at the outlet of the oven. The construction is simple and the free path for the pizzas ensures that no pieces of food remain in the oven to cause odours or burning. 1.4.77 as 759302 Div.ex. 2714761 (10pp1370)

WERN ★ D11 49266B/27 ★DT 2757-618
Multideck baking oven - with cut/off valve for one deck coupled to draught control throttle in waste gas flue

WERNER & PFLEIDERER 23.12.77-DT-757618
(28.06.79) A21b-01/26

A multi-deck baking oven with circulating hot gas is equipped with a shut-off device for the gas flow to one deck with a throttle valve for the induced draught control. Shut-off and throttle valve are actuated by a common linkage in such a way that opening of the shut off valve closes the throttle, and vice versa.

Provides a simple way of adapting the combustion conditions to the connection or disconnection of one deck. 23.12.77 as 757618 (7pp39)

NISP ★ D11 49447B/27 ★DT 2856-195
Noodle dough paste - in sandwich layers with differing specified starch and albumin content

NISSIN SHOKUHIN KAISHA 27.12.77-JA-160628 (27.12.77-JA-160627)
(28.06.79) A23l-01/16

Dough paste for noodles or the Japanese 'Udon' is made o wheat flour as a multi-layer laminate. An inner layer is enclosed in sandwich fashion between pairs of outer layers The ratio of starch to albumin in each of the outer layers is held much higher than for the inner layer.

Such a paste can be produced in mass prodn. without risk of breaking up. The paste can be quickly prepd. for consumption by hot water. The swelling in hot water is kept within limits. 27.12.78 as 856195 (25pp39)

TOSU- ★ D11 49509B/27 ★GB 2010-661
Forming dried foamed noodles - by circulating hot moist air through steamed noodles prior to cooling

TOYO SUISAN KAISHA 23.12.77-JA-155183
(04.07.79) A23l-01/16

Prodn. of dried and foamed noodles of the α-type includes repeatedly blowing circulating moistened hot air at 105-180°C for several mins. The air is moved onto and through the masses of steamed noodles at 2-10 m./sec. The noodles are continuously brought into a sealed drying chamber. The masses of noodles discharged from the drying chamber are discharged into a cooling chamber where they are contacted with cool, dry air.

The method is used to produce foamed noodles which may be used as an instantly cookable food. Except for the first few mins. of operation the noodles are not scorched by drying process. Also the resulting noodles have a pleasant taste having lost their dough odour. 1.12.78 as 046864. (6pp295)

RIJK- ★ D11 50232B/27 ★NL 7714-151
Prodn. of egg rolls - involves rolling the jacket from a dry dough so that no pre-baking is required and a non-porous jacket is formed

MACH C RIJKAART BV 20.12.77-NL-014151
(22.06.79) A21c-09/06

An egg roll is manufactured by rolling a dough consisting primarily of flour to a strip of the required thickness, cutting it to lengths and wrapping it a number of times around the filling to achieve the desired structure. The rolling process consists pref. of a number of rollers in series to reduce the thickness to 0.5mm. The viscosity of the dough is higher than 10,000 cp.

Due to the dry consistency of the dough, no preliminary baking operation is required so that the dough does not become porous. The consequent quality of the egg roll is considerably improved. 20.12.77 as 014151(5pp1370).

D12 : MEAT ; FISH PROCESSING

DALM- D12 04209A/03 =DS 2741-380
Treating shell fish esp. krill to obtain the whole muscles - by heating, mechanically treating then separating

DALMOR POLOWOW DALE 14.09.76-PO-192426
*(28.06.79) *BE-858-698 A22c-29/02*

Edible flesh is obtd. from antarctic krill by heat treating the krill in water at 70-150°C.. washing and cooling with the krill at 5-1500 g, whilst abrading the krill against a series of rods or sieves whereupon the scales and head spearate from the tail flesh. The final sepn. occurs through flotation in which the tail sinks and the remaining parts float.

Method enables edible, relatively damage-free flesh to be obtd. from the very small shrimp-like krill without including the possibly harmful contents of the stomach. 14.9.77 as 741380 (4pp1370)

ED- ★ D12 49236B/27 ★DT 2756-995
kinless sausage mfr. - with infrared heating of strand moving ong tube and slicing cutter
RIEDEL-TECHNIK GMBH 21.12.77-DT-756995
A97 (28.06.79) A22c-11

kinless strands of sausage are produced by pushing the ausage meat by a worm section through a tube where it is xposed to infrared heat. The next section can be used to ool the sausage by expanding compressed air and at the utlet from the tube, the sausage is cut into slices ready or sealed packing.

The arrangement saves much manual labour for removng the skin before the sausage is sliced and packed. It lso saves the disposal problem for the water in which oiled sausage is treated. 21.12.77 as 756995 (12pp39)

NME- ★ D12 49352B/27 ★DT 2843-388
Moulding press for meat, esp. boneless ham - with mould in five arts for easy exchange
IND MEC CGZ ALIMEC 15.12.77-IT-030728
(28.06.79) A22c-07

moulding press for meat, esp. for boneless ham, has on he press table a fixed part of the mould. Two lateral arts, which can be moved by hydraulic pistons towards ach other, and one mould part, which represents the tail nd of the ham and can be moved at right angles to the ther two, form the finished shape of the ham when fully ushed together. An ejector removes the finished ham rom the mould.

The parts of such a mould can be easily exchanged for thers (dovetail joints) if other shapes are desired. The nodule system simplifies stockkeeping and reduces the umber of moulds to be kept in stock. 5.10.78 as 843388 12pp39)

OME= ★ D12 50466B/27 ★SU -623-153
ausage meat structural-mechanical properties evaluation - using lling indenter which actuates electrical circuit, to rotate easurement recorder discs
MOSC MEAT DAIRY IND 21.02.77-SU-455171
R16 (22.08.78) G01n-33/12

evice for studying the structural-mechanical properties f visco-plastic products, e.g., sausage meat, comrises a body, rod with indentor, and mechanism to reord the penetration of the indenter. The measurement ccuracy and operational convenience are increased by dditionally providing the recording mechanism with a raking mechanism, stop and buffer elements fo the inentor and control elements. The indentor penetration ecorder mechanism is made from two discs disposed on he same axis, one fastened so that it is free to rotate and s linked by a roller to the braking element, and the other irmly connected to the spindle and engaging with the rod f the indentor through a pinion wheel via a toothed segment.
osoi, V.D., Zvonov, O.V., Titov, E.I. Bul. 3/5.9.78. 21.2.77. as 455171 (3pp29)

EL- D12 42077W/25 =SU -623-495
oultry-plucking machine - with plucking elements having a pulsed otion
ELELMEZESIPARI TERV 05.12.73-HU-EE2191
*(21.08.78) *NL7415-893 A22c-21/02*

Appts. for plucking poultry has rotatable plucking discs with felixible plucking elements supported by beam-type carriers. The beam-type carrier are articulated not on to each other but also to the machine frame, and a proportion of the series of plucking discs are fabricated partly or wholly of flexible material, while on the remaining plucking discs the plucking elements are arranged on a circle eccentric w.r.t. the axis of rotation of th disc.

The use of a special type of motion for the plucking elements gives better utilisation of the energy supplied and therefore better plucking of the poultry.
Nad, S., Sigeti, M. Bul. 33/5.9.78. 4.12.74. as 092621 (4pp)

LENG= ★ D12 50477B/27 ★SU -623-5
Animal stunning device used prior to slaughtering - has chamb with frame and wall mounted electrodes which spread electroly on animal skin
LENGORISPOLKOM VYMP 03.02.77-SU-450065 (03.02.77-SU 450064)
(01.08.78) A22b-03/06

Device for stunning animals using electricity, comprise a chamber with a bottom on which a supporting frame is installed and rotating electrodes. The electrical stunnin process is speeded up, by fitting the electrodes with container for the electrolyte. These are made hollow and have holes to allow the electrolyte to pass through on to the skin of the animal. The electrodes are mounted on the walls of the chamber between the supporting frame and the bottom. The holes in the electrodes are made as slits and filter cloth is placed inside the hollow electrode
Petrakov, V.K., Fasolko, K.Yu. Bul. 34/15.9.78. 3.2.77. as 450064 (3pp29)

DALM- D12 19714A/11 =US 4158-24
Machine to extract edible muscles from crustacea - esp. antarcti krill fresh or frozen on ship or shore
DALMOR POLOWOW DALE 03.11.76-PO-193450
*(19.06.79) *BE-860-439 A22c-29/02*

Apparatus for shelling antarctic krill comprises a highspeed rotor vertically in a casing and cooperating with an open container holding krill. The container has a passag for gravity discharge of processed material. The casing has a discharge passage on a bed and has a removable sealing lid.

A replaceable working disc is secured to the rotor, an a cylindrical chute with a circular base is above the disc line with the shaft axis. The chute is vertical and adjustable by a retaining ring. A toothed ring in the chute lowe end mounts bars and angle bars on a horizontal collar wit the bar tips chamfered and the angle bar tips not less thar 20 mm below the disc working face outer edge. 20.10.77 as 844104 (10pp1358)

OPF- ★ D13 48997B/27 ★BE -873-171
ozen potato chips prepn. - by precooking cut chips in non-fat edium until just not cooked, and partially drying
TOP FOODS ELBURG 02.01.78-NL-000047
(29.06.79) A23l A23p

eady prepd. prod. for potato chips and similar prods. is ade by first cutting peeled potatoes into chips or other hapes and opt. blanching and cooling them. The chips are hen heat treated in a non-fat medium for a period such hat they are still just not cooked, after which they are partially dried.

The chips contain little fat and have good storage properties at normal refrigerator temps. (4°C). When required for consumption, they can be deep dried easily in hot fat to give high quality fried chips. 29.12.78 as 873171 (10pp513) (F1)

- ★ D13 49000B/27 ★BE-873-181

asing the nutritional value of wheat milling wastes - mainly , by grinding to specified particle size

EALDYME 22.08.78-FR-024333 (10.01.78-FR-000500)

(29.06.79) A21d A23l

wastes obtd. during the various stages of wheat grind- are ground or micronised to obtain a product of which east 85% passes a 100u sieve and almost all passes a u sieve. The product is used in food compsns., esp. ad. The process at least doubles the nutritional value he material which is mostly bran. In bread, advantages obtd. in digestibility, texture, colour, taste and con- vation.

The process is pref. applied to soft wheat and before ling the wheat is pref. washed with at least 2% of nking water. The amt. used in bread is pref. 1-5%, esp. -1.7%. 29.12.78 as 873181 (13pp597)

JJ/ ★ D13 49014B/27 ★BE-873-265

ter-soluble sugar prod. contg. essential oils - prepd. by pregnating sugar with the oil, used in food, drinks and odorising compsns.

POUJADE O 03.01.78-FR-000088

(D22) (02.07.79) A23l C11b

e sugar prod. is prepd. by impregnating the sugar with e oil without using solvents and then storing the sugar r a sufficient time to completely impregnate it and to low reaction between the constituents of each to form a ter-soluble prod.

The prod. is used to make aq. compsns. and aq. infu- ons. It can be used to make drinks or as a food additive p. in desserts, ices, and in the prepn. of meat and vege ables. The solns. may also be used as deodorising comp ns. The process overcomes the disadvantage of the water nsolubility of the essential oils. 2.1.79 as 873265 (6pp)

JOM- ★ D13 49035B/27 ★BE-874-413

mpsns. contg. desired sodium potassium magnesium calcium tios - give electrolytic balance in pharmaceuticals and foods such table salt, milk products, cheese, sausage, chocolate, drinks etc.

SUOMEN LAAKETEHDAS 24.02.78-SF-000627

B06 (18.06.79) A23l

ompsns. for oral admin. which contain cations in desired hysiological ratios, are prepd. by mixing the cpds., in nown manner, in proportions such that the molar ratios f the obtd. products falls within the following limits:-

otassium:Sodium=1:10 to 100:1 (pref. 1:1) and/or
otassium:Magnesium=1:10 to 100:1 (pref. 3-4:1) and/or
lagnesium:Calcium=1:10 to 100:1 (pref. 1:2-1).

Used for preparation of products with cations in the esired ratios so as to avoid health problems due to food, nedicaments, etc. contg. disproportionate ratios of lectrolytes e.g. electrolyte inbalance may lead to hyper- ension, cardiac troubles as vascular degeneration. 3.2.79 as 874413 (34pp395)

ERF- ★ D13 49043B/27 ★BE-874-461

Chewing gum contg. liq. flavoured filling - which contains liq. orbitol, propylene glycol and flavouring

PERFETTI SPA 13.03.78-IT-021167

(18.06.79) A23g

The gum, in which a filling is encapsulated in a chewing um body, contains a filling liq. comprising an aq. soln. contg. dissolved solids, liq. sorbitol in an amt. of 8-13 (10)% of the filling liq. and a propylene glycol soln. of a lavouring agent in an amt. of 2-5(4)% of the filling liq.

A stable filling, which on storage retains both its luidity and flavour intensity, is provided.

The ratio of flavouring agent to propylene glycol is pref. 1:4. The filling liq. is prepd. by adding the sorbitol liq. and flavouring soln. to a 75% aq. soln. of mixed sugars at room temp. 26.2.79 as 874461 (8pp597)

OETK- ★ D13 49054B/27 ★BE-874-511

Prepn. of frozen vegetable mixts. for mixing with water - using granulation step to prevent sepn. of constituents

OETKER TIEFKUHLKOST 14.07.78-DT-830918

(18.06.79) A23l

The prepns. comprise a mixt. contg. blanched vegetables with more or less pre-cooked constituents such as pota-

les, in which are incorporated dry thickeners contg. taste enhancers and flavourings. An esp. fabricated granulate is fixed on the frozen vegetables to present as far as possible sepn. of the constituents.

The products are mixed with water to obtain savoury dishes. The above prevents sepn. of the components and enables individual portions to be removed without variation in quality. 28.2.79 as 874511 (8pp597)

CHAJ/ ★ D13 49058B/27 ★BE-874-522

Health additive for human food comprising defatted soya - contg. 35 per cent or more soya polysaccharide(s)

CHAJUSS D 05.01.79-IL-056383

(18.06.79) A23l

The additive consists of a derivative or extract of soya, which is substantially free from fats, mono- and oligosaccharides and other water-soluble soya cpds. and which contains 35% or more of soya polysaccharides.

It may be prepd. by (a) aq. extraction of non-roasted defatted spya flower followed by drying; (b) as (a) using a moderately alkaline medium; (c) isoelectric extraction using an acid aq. medium followed by aq. alkaline extraction; (d) aq. alcoholic or sl. acid medium extraction followed by drying and grinding, followed by sepn. of fines to give fractions rich and poor in polysaccharides or (e) aq. extraction by steeping and wet grinding of whole soya followed by sepn. and drying.

The above is beneficial to health e.g. lowering of choles -terol totals and blood pressure, improved glucose tolerances and less digestive troubles. 28.2.79 as 874522 (8pp)

BALL/ ★ D13 49078B/27 ★DL-134-909

Butter making machine - with beater strips on revolving spindle and disc on cream entry end

BALLA A 16.03.78-DL-204203

P13 (04.04.79) A01j-15/06

A butter-making machine consists of a horizontal drum with a revolving spindle, fitted with beater strips. A disc at the cream inlet end leaves a large annulus against the cylinder walls. The preferred number of beater strips is six or eight.

The machine is uncomplicated. It is capable of converting a fat-in-water emulsion into a water-in-fat emulsion with a minimum of energy consumption. 16.3.78 as 204203 (9pp39)

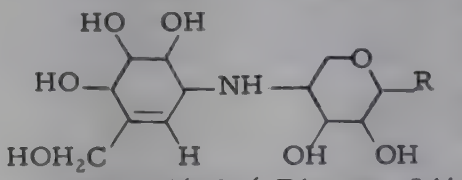
FARB D13 67509W/41 =DS 2462-836

Microbial amino-sugar cpds as feed-additives - to increase meat/fat ratios and improve feed utilization

BAYER AG 21.03.74-DT-413720 (21.03.74-DT-462836)

*B03 C02 (28.06.79) *DT2413-720 A23k-01/22*

A premix for feedstuffs contains 0.1-50 wt.% (0.5-5.0 wt.%) of $\geqslant 1$ cpd. of formula:



(where R is an oligosaccharide chain contg. 1-40 hexose units) to reduce fat formation and increase lean meat growth.

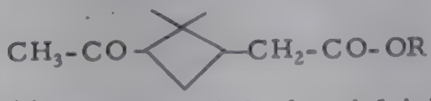
A fragrance contains a cpd. of formula:



(I) (where R = 1-6C alkyl).

(I) have an original and fairly intense green note redolent of reinous, pine or castoreum notes and may be used in amts. of (gen.) 0.5-10 wt.% of a perfumed compsn. 2.6.76 as 624654 (3pp922)

BARN- D13 29152Y/17 =DS 2654-597

Sorbitol and xylitol compsn. for sweetening edible prods. - esp. sweets and chewing gum, not causing tooth decay

BARNANGEN AB 11.12.75-SW-014030

*B05 E17 (28.06.79) *BE-849-279 A23l-01/23*

A sweetening agent comprises 1-50 wt.% xylitol (I) and balance sorbitol (II). (I) is pref. ⩽ 25 wt.% and the (I):(II) wt. ratio is 1:6-30.

The agent, which is less caries-causing than cane sugar, is esp.useful in chewing gums and sweeteners. 2.12.76 as 654597 (8pp922)

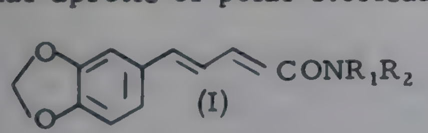
HAIM D13 70992A/40 =DS 2712-779
Cylindrical cheese mould - with support mats on both sides of bottom surrounded by radial slots
ALPMA ALPENLAND-MAS 23.03.77-DT-712779
*P13 (28.06.79) *DT2712-779 A01j-25/13*

A cheese form comprises a cylindrical wall and closed floor. When the form is stacked, the floor serves as a floor surface for the cheese in the form whilst being in contact with the upper surface of the cheese in the form below it. To permit the whey to drain from the cheese, the floor is equipped both above and below with grids. Slots in the walls of the floor retaining part of the form allow the collected whey to drain from the form.

Due to the grid construction of the floor and draining of the whey, the cheese does not adhere to the floor of the form and can be easily removed. 23.3.77 as 712779 (4pp1370)

FARB ★ D13 49201B/27 ★DS 2757-483
Piperonylidene-crotonic acid amide derivs. prodn. - from piperonal and crotonic acid amide, useful as condiments, insecticides, analeptics etc.
BAYER AG 22.12.77-DT-757483
B02 C02 E13 (28.06.79) C07d-317/60 C07d-405/06 C07d-413/10

Prodn. of piperonal derivs. of formula (I), comprises reacting crotonic acid amides of formula $CH_3.CH{=}CH.CONR_1R_2$ (II) with piperonal in presence of a hydroxide in an inert polar aprotic or polar sterically-hindered protic solvent.



(I)

(R_1 and R_2 = H, opt. subst aliphatic, araliphatic or aromatic hydrocarbyl, or together complete a heterocycle. They cannot both be H). The hydroxide used is of formula $R_3R_4R_5R_6Z^+ OH^-$ or $A^+ OH^-$ (Z = P or N). R_3, R_4, R_5, R_6 = opt. substd. alkyl, cycloalkyl, aralkyl or aryl, or two complete a heterocycle (opt. contg. other heteroatoms); when Z is P up to 3 of them can be dialkylamino. A^+ = alkali metal complex of a crown ether).

(I) are useful as condiments; additives for germicidal compsns.; insecticides or insecticide synergists, and analeptics for morphine and barbiturate poisoning.

Process has few reaction stages; requires no reagents which require special handling techniques; and gives higher yields. 22.12.77 as 757483 (7pp1251)

Draining whey from curds in cheese mould - in cooking vessel to eliminate need for separate vacuum draining chamber
MKT-TEHTAAT OY 30.09.77-FR-029594
P13 (01.06.79) A01j-25/11

The process is of the type in which a mixt. of curds and whey is piped from a cheese cooking vessel into a strainer mould which retains the curds while draining off the whey. The mould is now located in the open top of a cooking vessel. The mixt. of curds and whey is pumped into the mould which drains whey back into the cooking vessel. Pref. the mould presents an open top above the surface of whey in the vessel, while the drainage area of the mould is submerged below the whey surface.

The mould is pref. suspended from a lifting block
which it can be raised clear of the vessel. The lifting
block should be hung from a runner on a horizontal be
The curds are not exposed to atmos. during draini
as in the case of cheese cloth draining. This is achie
without the expense and inconvenience of a separate,
ed top, vacuum draining chamber. The new arrangem
can be used to convert existing installations. 30.9.77

Appts. for mechanically salting fresh pickled cheese - has pneumatically operated head on movable carriage with suction ports and brine injection needles

DSO MLECHNA PROM 14.12.77-NL-013819

P13 (18.06.79) A01j-27

Pickled cheese is salted and packed by means of a device mouned on a rail track equipped with a vertically moving piston to which two chambers are attached, one for drawing and maintaining a vacuum, and the other for feeding salt solution into the cheese. The vaccum chamber is connected to a series of vaccum heads with suction ports which are placed in contact with the cheese and hold the head firmly against it. The ports are also equipped with valves so that, in the event that the surface of the cheese does not permit one of the heads to bed down, the valve closes and the vacuum in the chamber can still be maintained.

The salt solution chamber is coupled to needles which pass through the vaccum chamber and ports although isolated from them and are injected into the cheese as the head is lowered. The needles have drainage ports which distribute the injected brine into the cheese. The injection needles are pref. 7-9 cms long with an internal diameter of 0.4-0.8m.

The device enables the salting of the brine to be incorporated into a packing line with a saving of labour and space. 14.12.77 as 013819(8pp1370).

Chelated granular trace element fertiliser prodn. - from sulphite pulp mill waste water, using neutralisation process
KIMURA T 08.11.77-JA-133040
C04 F09 (28.05.79) C05f-07/02

A sulphite pulp mill waste liquor is first neutralised with the oxide of a trace-element metal, the neutralised waste liquor is then concentrated until approx. 50% water content is reached by using a multiple-effect vacuum evaporator, the concentrated waste liquor is then pulverised by using e.g. a spray drier and the pulverised waste liquor is subjected to e.g. a pan-type granulator to obtain a chelated granular trace-element fertiliser.

The strongly acid digesting waste liquor in the mfr. of sulphite pulp is neutralised with the oxides of trace-element metals with the intention of using lignosulphonic acid (a chelating agent) present in the pulp mill waste liquor in contrast to the conventional method in which the neutralisation is made with lime. 8.11.77 as 133040 (1pp117)

Composting organic sludge - e.g. excess sludge generated in activated sludge treatment, using high concn. oxygen
SHOWA YUNOX KK 08.11.77-JA-133092
C04 R26 (D16) (28.05.79) C02c-01/06 C05f-07 C12b-01 G05f-09/04

A method of composting organic sludge, e.g., excess sludge generated in activated sludge treatment and mixts. of the excess sludge, wood powder, urban refuge and other organic wastes convertible into compost in which waste water, a high concn. of oxygen-contg. gas, and return activated sludge are introduced into an aeration tank, where they are mixed by means of a mechanical stirrer and excess gas is discharged into the outside, for example, then the mixed liquor treated by aeration is sent to a clarifier to separate it into supernatant liquor and activated sludge.

The supernatant liquor is discharged and most of the activated sludge sent back to the aeration tank, while a part of the activated sludge is continuously or intermittently introduced into a dehydrator as excess sludge. The excess sludge after being dehydrated is introduced into a mixing tank and mixed with an organic solid waste of a high C/N ratio, e.g., urban refuge, chaff, etc., with a part of composted substance from a composting tank, the mixt. of excess sludge, organic solid waste and return compost in the mixing tank is then sent to the composting tank, where they are well mixed by means of a mechanical stirrer to uniform temp. distribution while introducing a part of oxygen, and lastly the crude compost made in the composting tank is subjected to a several week final fermentation to obtain

This method performs the composting of excess sludge simply and rapidly without generating offensive odours, while utilising exhaust gas form composting process using oxygen-rich gas as aeration gas for the activated sludge treatment. 8.11.77 as 13309? (4pp117)

Waste water clarification and purificn. - includes coagulation of colloidal particles in waste at soluble electrodes in mixed constant and alternating electrical fields

GORSHKOV V P 15.11.76-SU-419652

J03 (25.07.78) C02b-01/82 C02b-09

Passage of aq. waste contg. colloidal particles through an inter-electrode space between soluble metal electrodes results in formation of a metal hydroxide which catalyses coagulation.

The efficiency of the coagulation can be increased if the process is carried out in mixed constant and alternating fields, instead of in constant field only, which could only give efficient conversion at high prolonged treatment times.

Airport surface run/off rain water purificn. - includes settling and biological treatment to remove petroleum prods. etc. at low cost

WATER STORAGE RES (AERO=) 01.12.76-SU-424633

(25.07.78) C02c-05

Surface drainage from an airport is collected, sepd., and stored, then treated by biological cleaning.

The method can be simplified if the drainage running off on pptn. of 0-10 mm. is stored, allowed to settle, then cleaned biologically; the drainage running off on subsequent pptn. of up to 5 mm. is stored for 1-3 days prior to cleaning; and the drainage running off on further pptn. is passed directly to a reservoir.

The water obtd. by this method satisfies health standards, and the method avoids the need to transport the whole vol. of run-off to a municipal works for treatment with domestic and farm waste, as before.

Bukholdin, A.A., Rokshevskaya, A.V., Sverdlov, B.S. et al. Bul. 33/5.9.78. 1.12.76. as 424633 (2pp815)

Organic cpds. elimination from aq. effluents - by adsorption on shungite modified with alkaline aluminium nitrate

LENINGRAD PLEKHANOV MINE (AKFG=) 26.01.77-SU-446997

E19 (25.07.78) C02c-05/02

Organic cpds. e.g. phenols and oleic acid removal from waste water can be increased if the adsorbent of shungite is modified by treating it with basic aluminium nitrate, instead of alkali alone as before, since this did not give adsorbent with a sufficiently high specific surface. Modification of shungite with particle dia. 5-10 mm. was carried out using alkaline aluminium nitrate with the formula $Al_2(OH)_5NO_3$, then the adsorbent was used to treat waste contg. organic impurities at an irrigation rate of 10-12 $m.^3/m.^2$ hr. The residual concn. of impurities was reduced to 0.12 g./l. after 15 min., 0.08 after 60 min., and 0.05 after 240 min., corresp. to a degree of purificn. of 96.6%, compared to a value of 94.8 obtd. fc adsorbent treated by alkali only.

The modified shungite gives an increase of ~ 2% in level of purificn. and is less expensive than activated carbon or zeolite.

Removing oil from rolling mill waste water - by mixing with purificn. plant waste water and spraying mixt. in waste gas con adsorbent particles suspension

DONETSK FERR METAL 18.02.77-SU-453988

J01 (25.07.78) C02c-05/02

The efficiency of removing oil from waste water can be increased and the cost of the process reduced if the was is mixed with wash water from industrial gas cleaning, a vol. ratio of oil in waste to wash water of 1:1000-10,0 then the mixt. atomised in a current of waste gases contg. suspended particles of adsorbent, such as iron oxide, calcium carbonate or sulphate.

The method is an improvement on treating the water with finely divided particles of adsorbent directly, as it less complex, gives an increase in the level of purificn of 10-15 times, eliminates the need to prepare finely divided adsorbent, and produces water which can be use repeatedly. Treatment of water contg. 649 mg./l oil gave an oil level of 18 mg./l in the product by the proposed method, compared to a value of 278 by the previou method, and used 7000 ml. of wash water.

Petrovskii, O.V., Myagkii, D.D., Veselyii, A.G. et al. Bul. 33/5.9.78. 18.2.77. as 453988 (2pp815)

Selective removal of aromatic amine(s) etc. from waste water - by passing waste through steam treated polymeric membrane based on polyether and di:phenylmethane di:isocyanate

AVDONIN YU A 03.09.73-SU-959432

A97 E14 (A25) (02.08.78) C02c-05/02

High quality water from aq. waste contg. amines can be obtd. if the waste is passed through a steam-treated polymeric membrane prepd. from 4,4'-diphenylmethan-diisocyanate and a satd. simple polyester, with mol. wt. 900-5000, with addn. of isophthalic acid dihydrazide as a chain extender, in a wt. ratio of 52:120:40.

The mol. wt. of the ether is critical as polymer prepd. with a lower wt. ether has poor adsorption properties, while one prepd. with a higher wt. ether is not sufficiently permeable.

The method gives a higher degree of removal of amines than the use of formaldehyde, which required an exact pH value and gave water contaminated with formalde-hyde. Passage of water contg. 1.9 g./l. aniline through a membrane based on polyurethane gave treated water contg. 0.37 g./l. aniline, corresponding to a selectivity for aniline of 80%.

Dynamic self-cleaning liq. filter - has sonic sinusoidal wave inducing transducer fixed to outside of resonant tube
BEEHLER V D 05.07.77-US-812569 (23.08.76-US-716529)
J01 (19.06.79) B01o-29/36

Continuous self-cleaning liq. filter has an outer resonant tube concentrically mounted around an inner composite tube to define an annular chamber between them. The inner tube consists of a thin walled perforated liner enveloped in a filter blanket. Liq. to be filtered is introduced at one end of the annular chamber and residual concentrate is discharged from the other. The inner tube has an outlet at one end for clear effluent and a closed opposite end.

A sonic sinusoidal wave inducing transducer is fixed to the outside wall of the outer resonant tube at an antinodal point to excite the outer tube into resonance. This continuously transforms the liq. to be filtered within the annular chamber into a state of intense vaporous cavitation energy which implodes the filter blanket surfaces causing accumulated residue to be continuously removed and returned to the concentrate flow in the annular chamber.

The filter is continuously cleaned without the addn. of cleaning agents, e. g. acids. Cleaning occurs deep within the interstices of the filter blanket. 5. 7. 77 as 812569 (+30. 4. 75, 20. 11. 75, 23. 8. 76-US-573043, 633818, 716529) (7pp67)

Sprinkling wine through marc in fermenting vessel using flinger wheel - to obviate blocking of orifices and reduce power required

FABBRI F 30.09.77-FR-030163

P42 (01.06.79) B05b-03/04 C12g-01

A liq. sprinkler comprises a rotary bladed flinger wheel onto which an open-ended pipe delivers the liq. as the wheel is rotated by a drive system. The drive system pref. comprises a turbine rotor fixed on the flinger wheel shaft and powered by liq. which is eventually sprinkled by the flinger wheel. Alternatively, the flinger wheel shaft may be rotated by an electric motor.

The flinger wheel is pref. fixed to the lower end of a vertical shaft which is extended centrally inside the top of a wine fermenting vessel. Wine drawn from the vessel is recycled by pumping through the pipe delivering onto the flinger wheel.

Used for spraying liqs. heavily charged with particles, esp. recycling wine drawn from a fermenting vessel by sprinkling it ontop of the cake of marc inside the vessel. There are no small orificies to block up. The sprinkle is evenly distributed over an extensive area with only a very low power requirement. 30.9.77 as 030163 (10pp448).

Continuous malting of grain using pre-germination vessels - having lower perforated aeration screens and sleeping arms

SIMPSON & CO LT J P 10.03.77-GB-010244

(04.07.79) C12c-01/02

Continuous malting of grain includes pumping grain through a rotary washing and wetting unit from a metering unit and spraying the grain as it enters a pre-germinating vessel. The grain is sprayed further as it enters another pre-germinating vessel and is transferred to a germination unit and passed to a drying and kilning unit. Malt is subsequently delivered from the appts.

The pre-germinating vessels are each formed with a perforated cone and a discharge cone supported by beams with sweep arms rotating between the two cones.

Continuous steeping of grain by spraying allows the grain to enter the germination unit at the optimum moisture level. There is a redn. in the amt. of water used, redn. in effluent after steeping, increased depth of grain and increased malting capacity. The perforated cones allow air and grain to pass through the vessel evenly and be continuously discharged. The grain takes up moisture evenly as it moves down each vessel. 27.2.78. (4pp1044)

Reagent for L-lysine determn. - comprises L-lysine-alpha-keto-glutaric acid epsilon-transaminase, dehydrogenating enzyme, coenzyme and alpha-keto-glutaric
MITSUI TOATSU CHEM INC 08.11.77-JA-133005
B05 E16 J04 R16 (29.05.79) G01n-31/22

The reagent comprises (a) L-lysine-alpha-keto-glutaric acid-epsilon-transaminase, (b) L-glutamic acid dehydrogenating enzyme, (c) coenzyme and (d) alpha-keto-glutaric acid.

The reagent is used for selective determn. of L-lysine in the presence of other amino acids. The determn. can be carried out simply with high accuracy, in a short period of time.

L-lysine in the sample, pref. reacts with alpha-keto glutaric acid in the presence of the enzyme (a) and coenzyme (pyridoxal-5'-phosphate) to give alpha-aminoadipic acid delta-semialdehyde and L-glutamic acid. The result-

ing L-glutamic acid is pref. dehydrogenated in the presence of the enzyme (b) and coenzyme (typically nicotinamide-adenine dinucleotide, NAD) to yield alpha-keto-glutaric acid, ammonia and hydrogenated NAD(NADH$_2$) of which quantity is equivalent to that of L-lysine present in the sample. Thus, NADH$_2$ is determined by measuring UV absorption, and the L-lysine content in the sample is calculated from the NADH$_2$ content in the reaction mixt.

hydrophobic adhesive mfr. from by/product of sulphate cooking - includes addn. of alkali metal chloride of sulphite or oil to fermentation waste, used in ceramic, mining, building materials mfr., etc.

PERM POLY (CEPA) 30.03.76-SU-351447

F09 L02 M22 (24.08.78) B01j-02 D21c-11

Spent lye from the sulphite-cooking of cellulose isused as a nutrient medium for yeasts; the residual liquor is concentrated (to 30-50% of solids) and dried to powder (residual moisture content 8-10%).

The method is improved by treating the powder with 5-10% of the chloride or sulphate of an alkali metal, or an oil, at 35-70°C. The product is then cooled to 30-40°C granulated and treated with an air stream in a fluidised bed at 10-15°C. By this method, the adhesive properties of the powder are improved, and its hydrophilic tendency is suppressed. The transport, storage and handling of the product are facilitated.

The prod. can be used as a binder for metal-casting moulds, or cores; in petroleum mining as a stabiliser for clay suspensions; in ceramic, cement and building materials industries as a dispersing agent, binder or plasticers; in agricultural chemistry as a wetting agent for pesticides and seed-dressing compsns. etc. The compressive strength of the granules is 25-45 kg/cm^2; the tensile strength is 8-10 kg/cm^2.

(19.06.79) C12b-01

Continuous enzymatic conversion of materials (I) is as follows: (a) a soln. contg. (I) and an enzyme (II) is continuously passed through several series-connected reaction zones in which (I) is continuously converted by (II); (b) the prod. from each reaction zone is continuously passed through an ultrafiltration zone (to separate (II) as the retenate) before it is passed to the next reaction zone; (c) sepd. (II) from each filtration zone is continuously recycled to the reaction zone it came from; (d) the prod. is continuously collected from the filtrate from the last of the filtration zones, while partly spent (II) is passed back from each reaction zone to the next proceding zone.

The reaction zones and filtration zones form a closed circulation circuit, and fresh (I) is continuously passed to the 1st reaction zone, and fresh (II) is continuously passed to the last reaction zone so that (I) and (II) are in countercurrent flow.

Process gives high rates of conversion of (I) with simultaneous retention of (II), and is suitable for use on an industrial scale. Typical suitable processes include the degradation of polysacchandes to mono- and di-saccharides, or disaccharides to monosaccharides; and the isomerization of mols. 29.12.77 as 865621 (+19.9.76-US-723882) (6pp478)

ticle printing method - comprises transferring print through colour
lvent from paper to article
ALBIEZ E 23.12.77-DT-757630
G05 P79 (28.06.79) B44c-01/16

Colour or black/white prints are produced on articles, esp. those made of leather or wood, by producing a printing plate with the original and transferring the print to a flexible carrier (granulated art paper). The article is wetted with a colour solvent and the printed side of the paper is applied to it. Pressure transfers the print to the article.

This eliminates all difficulties with the instability and merging of colours. In the case of leather, it neutralizes the migration of tannic acid and ensures excellent durability.

Complex pictures can be transferred satisfactorily.

Pref. the printing plate is made by the offset printing method. The pref. print carrier is a granulated art paper. The colour solvent is a two-component mixt. of one part of a colour solvent without oil with four parts by wt. of a colour solvent with oil. 23.12.77 as 757630 (9pp39)

Sugar prodn. diffuser - has parallel augers with interconnected hollow brackets, and shafts for steam heating
KIEV FOOD TECHN 05.01.77-SU-441036
(03.08.78) C13d-01/10

Uniform heating and intensified extraction in the diffuser of sugar prodn. line are achieved by using hollow brackets to support the augers. Chambers are provided for feeding steam into the hollow shafts, which are connected to the brackets, as well as for draining condensate.

The two hollow shafts and brackets form rotary heating chambers ensuring thorough heating of cossettes fed from hopper by the two parallel augers. The extracting fluid flows in countercurrent to the cossettes. The juice passes through a mesh band while the pressed out pulp is discharged at the bottom of the diffuser.

The admission of steam through the hollow shafts increases the area of heating, and process of extraction is intensified by faster rates of beet protoplasm denaturation.

Animal skins treating unit presser roller control - has a throttle between servo rod end chamber and mineral fluid tank
ORLOVO LIGHT MACH 04.01.76-SU-309168
(22.08.78) C14b-17

Simplified pressing roller assembly in machines for the mechanical treatment of skins and also elastic sheet materials, as well as enhanced reliability, are due to feedback linkage. The pressing roller is advanced by the pneumohydraulic servo whose rod end chamber is connected to the tank holding a mineral fluid via a throttle.

The working chamber of the servo is connected to the valve held by the servohousing and connected to the control pedal by a rod. The clearance between the working and pressing rollers is set by a coupler, and depression of the pedal raises the positive overlap valve connecting the working chamber with the compressed air source. The difference in areas of the chambers determines the advance of the pressing roller, while valve overlap controls the response.

Stable, gelled cosmetic compsns. contg. organic solvent - and aluminium iso:stearate and opt. metal soap of other fatty acid

KOBAYASHI KOSEI KK 31.10.77-JA-130632

E12 (E17) (24.05.79) A61k-07

Prodn. of stable cosmetics (I) contg. liq. organic solvent (II), comprises mixing, in (I), (1) aluminium isostearate (III) or (2) (III) and metal soap (IV) of other fatty acid. Stable gelled (I) can be produced. Gelled cosmetics produced by other known methods sometimes undergo syneresis and their qualities change easily. (I) produced by the present method undergoes hardly any syneresis.

As (II), liq. paraffin, squalane, branched hydrocarbon of low b.pt., hexadecyl alcohol, isopropyl myristate, octyl decanyl myristate, fatty acid glyceride and others are used. More than 0.5 wt.%, e.g. (1-10 wt.%), of (II) should be added in (I).

In an example, (I) was produced by mixing, at first, 35.0 g of liq. paraffin, 30.0 g of isopropyl myristate, 10.0 g of lanolin deriv., 2.0 g of sucrose fatty acid ester, 6.0 g of (III) and small amt. of perfume and then kneading the mixt. with 5.0 g talc, 7.0 g of titanium, 0.5 g of iron oxide red, 2.0 g of ferrous oxide and 0.5 g of ferric oxide. 3.10.77 as 130632 (4pp42)

Aq. shampoo compsn. - contains anionic alkali(ne earth) metal surfactant and an adduct of ethylene- or propylene oxide and cholesterol

LION FAT & OIL KK 07.11.77-JA-133224
A96 E19 (A25) (26.05.79) A61k-07/06 C11d-01/83

The compsn. is of pH 3-6.5 and consists of an alkali metal or alkaline earth metal anionic surfactant, an adduct of 5-120 moles ethylene oxide or propylene oxide to cholesterols and water.

The compsn. smarts only slightly in the eye, and inflicts only slight damage to the hair. It has been found by the inventors that the alkali metal type or alkali earth metal type anionic surface active agents smart quite slightly in the eye when it is used in combination which cholesterol cpd. at 3.0-6.5 pH. Moreover, the amt. of the amino acids dissolved out of the hairs is remarkably reduced and the foam generating property of the compsn. is satisfactory. On the other hand, anionic surface active agents of ammonium salt, amine salt, or alkanolamine salt type smart considerably.

Pref. anionic surfactant alkali(ne earth) metal salt of 3 mole ethoxysulphuric ester of naturally occurring lauryl alcohol, 3 mole ethoxysulphuric ester of 11-15C fatty alcohol prepd. by the Oxo process, or 1 mole ethoxysulphuric ester of 12-13C Oxo fatty alcohol, sulphuric ester of 12-13C fatty alcohol, etc.; the cholesterol cpds. is 5-120 mole adduct of ethylene oxide or propylene oxide to cholesterol or isocholesterol, which may be a mixt. of lanosterol and agnosterol. 7.11.77 as 133224 (6pp126)

**Fluorescent ceramic compsn. for use as false tooth - prep
dispersing fluorescent material contg. aluminate, aluminosilic
alumino:silica and europium in powdered ceramic material**

SHOFU DENTAL MFG (SHOF) 26.10.76-JA-128974
*L02 P32 (19.06.79) *J53054-893 A61c-13 C09k-11/46*

A fluorescent dental compsn. is prepd. contg. a porc
material for artificial teeth, a fluorescent substance
an activator, such that fluorescent substance is prese
$\leqslant$ 1 wt.% of porcelain material.

Porcelain material contains feldspar, lencite, alu
or syenite as the main material, and has a softening t
of 600-800°C and undergoes vitrification at 900-1300°
Fluorescent substance is an aluminium silicate, alkal
earth) metal aluminosilicate, alkali(ne earth) metal a
nate or their mixts., such that alkali metal is sodium
potassium and alkaline earth metal is magnesium, ca
barium or strontium. Activator is europium, or euro
plus cerium and/or ytterbium as auxiliary activator.
Europium (Eu_2O_3) is present to $\leqslant$ 4 wt.% w.r.t. fluor
ent substance. Molar content of alkali(ne earth) meta
oxide) present is $\geqslant$ 4 times the molar content of alu
present.

Compsn. exhibits fluorescence of the range violet
white to milky white blue when excited by UV radiatio
3650 Angstroms. 22.9.77 as 835659 (3pp931)

Gaiters to protect a horses legs from bruising or sprain - are elastic fabric with an opening along their length

DANTO TRICOTS ELAST 28.09.77-FR-029881

P32 (01.06.79) A61d-09

Fetlock binders for sporting horses or racehorses take the form of 'gaiters' to protect the tendons of the leg fro bruising and sprains, and also to assist in certain indispositions due to injury or infection. The gaiters comprise an elastic fabric, open along its length and supplied with closure means to form a snug covering for part of the horse's leg.

The elastic constriction offers a continuous massage the leg during movement to improve circulation, reduce swelling, soften scar tissue, and reduce discharge. The elastic fabric may be fastened by hooks and eyes, or "Velcro" (RTM) hooked pile strips. 28.9.77 as 029881 (4pp1359).

fection and sterilisation process using ethylene oxide - mixed
combustion inhibitor to overcome flammability and toxic
rds
ALLER SA ENTREPRIS 30.09.77-FR-029527
13 P34 (E16) (01.06.79) A61l-13
ylene oxide is mixed with a combustion inhibitor which
ufficiently efficient in a small enough amt. to allow the
t. to be used at around atmospheric pressure. One vol.
bitor per vol. ethylene oxide is used at the most.
Suitable inhibitors are a brominated cpd., such as
Br, $CClF_2Br$, tetrafluorodibromoethane or MeBr. The
t. can be made by vaporising the ethylene oxide and the
nbustion inhibitor and expanding them under a pressure
r to atmospheric.
The mixt. is used for disinfection, sterilisation and/or
ing insects. The process simultaneously overcomes
two main hazards of ethylene oxide, viz. its flammab-
y and toxicity. The combustion inhibitor overcomes the
nmability, but because it need be used in small quantity
y, the pressure need not be raised substantially above
nospheric, with the attendant danger of escape of toxic

Cis jasmone prepn. by cyclising 1,4-di:ketone - prepd. from 4-ethylene-di:oxy-pentanal

TOYOTAMA KORYO KK 02.11.77-JA-132004
E15 (29.05.79) C07c-45 C07c-49/46

Cis-jasmone is produced by reacting (a) 4-ethylenedioxy-pentane-1-al with (b) the organic metal cpds. obtd. from cis-3-hexenyl halogenides, oxidising (c) the 2-ethylenedioxy-8-undecene-5-ol obtd. above with (d) oxidants and cyclising (e) the 1,4-diketone formed.

1,4-Diketone is synthesised with the aid of levulinaldehyde deriv., different from the conventional method employing levulinic acid deriv. Component (a) is synthesised by ketalating (1) the 1.1-diacetyloxy-4-pentanone formed by the radical reaction of acrolein diacetate and acetoaldehyde with (2) 1,2-glycols and hydrolysing the prod. with (3) alkali. Component (c) is produced quantitatively by the reaction of (a) and (b) (e.g. Grignard's reagent, lithium cpds.). Component (c) is oxidised with (d) (e.g. chromic acid-pyridine). Component (e) thus obtd. is treated with acids, e.g. 20% sulphuric acid. The target prod., cis-jasmone is obtd. by heating 1,4-diketone and diluted alkalis. 2.11.77 as 132004 (3pp136)

LIOC ★ D23 50113B/27 ★J5 4066-663

Spiro(5-isopropylbicyclo(3,1,0)hexane-2,2' oxirane) prodn. - by sabinene oxidn; used as perfume, flavourant and in trans-sabinene hydrate prodn.

LION DENTIFRICE KK 01.11.77-JA-131203
E13 (D13) (29.05.79) C07d-303/04 C11b-09

"Sabine oxide" is produced by the reaction of sabine and oxidants. Trans- and cis-sabinene oxides are produced under mild conditions. The trans-form is formed prior to formation of cis-form. Sabinene oxide is used as perfume, flavour, synthetic intermediate for the prodn. of trans-sabinene hydrate.

The starting raw material, sabinene is obtd. from the purified nutmeg oil, etc. As the nutmeg oil is purchased at a relatively low cost, use of nutmeg oil is profitable from the industrial viewpoint. Sabinene is also produced by the reaction of sabinaketone and methylenetriphenylphosphorane.

Oxidants include, e.g. perbenzoic acid, monoperoxyphthalic acid, peracetic acid, t-butylhydroperoxide vanadium (II) acetyle acetonate. Pref. are organic peracids. The amts. of the oxidants used are usually about 20 moles to 1 mole of sabinene. The reaction of sabinene and oxidants are performed in solvents (pref. methylene chloride, chloroform) at -15 to 100 °C, pref. < 60 °C for 1-10 hrs. 1.11.77 as 131203 (6pp136)

Continuous prodn. of processed butter - includes melting butter, thermally treating, two/stage sepn. and cooling to improve organoleptic characteristics
MILK CHEESE IND 04.02.77-SU-450317
(01.08.78) A23c-15/14

The processed butter is produced by melting the starting material, subjecting it to a thermal treatment, sepg. the plasma from the milk fat by two-stage separation, and cooling the butter.

The method is improved by continuously carrying out the thermal treatment at 105-110°C immediately after the melting of the starting material; then purifying the product by removing the proteins; and sepg. the fat fraction from the plasma by a successive two-stage sepn. By this method, the process is accelerated, and the quality and the organoleptic properties of the product are improved.

Non-scratching liquid scouring compsn. - contg. hard abrasive and soap to protect soft surfaces

JOHNSON S C & SONS INC 16.01.78-US-869416

E12 (E16) (19.06.79) C11d-09/02

A liquid scouring cleanser comprises 2-10 wt.% of a soap of formula RCOOM, where M is Na, K or $(R_1)mHnN$, m an n are 1, 2 or 3, m+n = 4, R_1 is 1-4C alkanol, and R is stearyl, oleyl or mixts. of these; 25-35 wt.% of an abrasive of Mohs hardness above 3; 1-7 wt.% of anionic surfactant and/or nonionic surfactant, 0.2-10 wt.% thickener, an water. The compsn. has ratio of soap to abrasive in the range 10:1 to 4:1, and pH 7.0-9.5.

Due to the cushioning effect of the soap, the compsn. does not scratch relatively soft surfaces, e.g. aluminium, even though it contains a hard abrasive. It is very effective in removing food encrustations, and leaves a protective film. 16.1.78 as 869416 (3pp955)

MONS ★ D25 50785B/27 ★US 4158-635

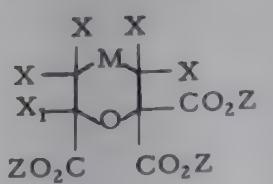
E13 (E12) (19.06.79) C11d-03/20 C11d-07/54

Detergent compsns. contain 0.5-95% by wt. water-soluble anionic, nonionic, zmphoteric, or switterionic surfactant (I), and 1-95% by wt. of a polycarboxylic acid deriv. (II) (where M is 0 or CY_2; Y is H or 1-4C alkyl; X and X_1 are H, 1-4C alkyl or CO_2Z; Z is H, R, alkali metal, NH_4, or trialkanolammonium; R is opt. branched 1-20C alkyl).



(I)

(II) are detergent builders, threshhold agents, Ca and Mg sequestrants, and scale dissolvers, and are useful for improving the cleaning ability of the surfactants (I). (II) are also useful in softening water, etc. 10.10.78 as 950182 (9pp478)

KEWA- ★ D25 50790B/27 ★US 4158-644

Hard surface cleaner and grease remover - contg. synergistic combination of nonionic, quaternary ammonium and betaine surfactants

KEWANEE IND INC 17.03.78-US-887785

A97 E16 (A25 E14) (19.06.79) C11d-01/90 C11d-07/32

A hard surface detergent compsn. comprises (a) a condensate of nonyl phenol with av. 9.5 moles ethylene oxide and condensate of octyl phenol with 9-13 moles ethylene oxide; (b) alkyl dimethyl benzyl ammonium chloride and/or alkyl dimethyl ethylbenzyl ammonium chloride (12-18C alkyl); (c) acylamido-propyl dimethylamino acetic acid or its salts, the acyl gp. being derived from coconut fatty acids. The ratio of components (a), (b) and (c) is 4. 5:3:1 by wt., and their total concentration is 0. 1-4% by wt.

The combination of the 3 components in the above ratios is more effective than any one or two alone, and more effective than dispersions of solvents, e. g. 2-butoxyethanol.
17. 3. 78 as 887785 (4pp955)

BATT D25 44432B/24 =WP 7900-346

Automatic washing machines - with integral electrolytic peroxide generators, for efficient bleaching action without subsequent pollution problems

BATTELLE MEMOR INS (PORT/) 06.12.77-CH-014876
*E36 F06 J03 (28.06.79) *EP---2-423 C25b-01/30 D06f-35*
D/S N(JA,US).

Process for washing and bleaching textiles using an aq. detergent bath contg. a detergent which is substantially free of bleaching agent is claimed, in which the bleaching action is obtd. by adding to the bath, at a selected time, an oxidising alkaline aq. soln. contg. hydrogenoperoxide ions. The alkaline soln. is pref. one produced immediately before its incorporation into the bath by an electrolytic method by reduction of O_2 in an alkaline medium.

The H_2O_2 is produced in dilute solns. close to the place of use. The dilute soln. does not have a deleterious effect on enzymes being used in the same soln. to bring about bacteriological cleaning, unlike the more concentrated commercially produced solns. The soln. does not have to be stored. Hence improved washing and bleaching of the textiles is brought about.
4.12.78. as CH 0043 (40pp396).
(F) ISR: FR 1335541. US 3969201; US 3616442.

BATT D25 44432B/24 =WP 790

Automatic washing machines - with integral electrolytic per generators, for efficient bleaching action without subse pollution problems

BATTELLE MEMOR INS 06.12.77-CH-014876
*E36 F06 J03 (28.06.79) *EP---2-423 C25b-01/30*
DS: N(US) + E(CH, DT, FR, GB, SW).

A method is claimed for preparing an aq. treating soln contg. at least hydrogenoperoxide ions and hydroxyl i in predetermined concns. variable within a given rang of values such that the soln. has a total concn. of H_2O_2 of 0.1-10 g/l and a pH < 14. The process consists of using an electrolytic cell comprising a porous cathod and circulating a pressure gas contg. O_2 and an aq. so which is slightly alkaline in contact with the cathode s as to form the ions by redn. of O_2. The circulation is continued until the soln. reaches the predetermined concns., and the soln. is then removed for use.

As a bleaching soln., e.g. for paper pulp, textiles,

The process produces the solutions in the strength required directly for use, rather than in high concns. which have to be diluted. The hydrogen peroxide can produced in situ where required rather than in bulk commercial plant.
4.12.78. as CH0044 (34pp396).
(F) ISR: US 3969201; US 3616442.

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

APPENDIX I

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distinguish accepted West German specifications (DAS) from t unexamined applications (OLS) which are given the norm DT code. in the case of Japan J5 represents t unexamined applications, and J7 the examined of t present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

Copies of Specifications may be ordered from our PATENTS SUPPLY DIVISION.

EUROPEAN PATENTS REPORT
PCT PATENTS REPORT

New publications in the World Patents Abstracts service provide detailed, documentation-type abstracts, with drawings, of **all EPO and PCT** applications within **14 days** of publication. Also reported with the **designated states**, and references cited in the **international search report**.

Annual subscription costs :—
European Patents Report : £250, $525 or Y 95,000
PCT Patents Report : £100, $210 or Y 38,000

As support documentation the abstracts and complete specifications are available on **microfilm.**
Descriptive brochures giving complete price list, and specimen copies, are available on request from the Subscription Department.

artaric acid esters useful as free flow bakery emulsifying -

NAMIT NOBEL AG 02.05.70-DT-021565 (02.05.70-DT-065772)
(05.07.79) *NL7103-042 A21d-02/22

sifier for yeast doughs is a solid, pourable powder of
etyl tartaric acid ester which is produced by reacting
. of a partial glyceride (57-63% monoester content)
4-22C fatty acid (iodine value <5) with 0.9-1.7
. (1.2-1.5 mols) diacetyl tartaric anhydride and 0.01-
nol (0.1 mol.) tartaric acid at 70-80°C with stirring,
ng in vacuo to 115-120°C and holding in the vacuum
hrs. at that temp. The prod. is then mixed with asc-
acid.
he powdery nature of the emulsifier makes it more co-
ient to use and enables dosages to be more accurately
d to the doughs. 2.5.70 as 065772 Div. ex 2021565

W/ ★ D11 51057B/28 ★DT 2758-643
y dispensing machine for waffles - using pressurised fluid for
y transportation and dividing into portions
CHMIDT M 29.12.77-DT-758643 (00.00.77-DT-701765)
(05.07.79) A21d-13/08

Parent Patent described a machine for filling honey
waffles. Instead of the original manual operation, pn-
atic or hydraulic means are not applied both to trans-
t the honey from the storage tank to the dispensing noz-
, and for the severing of the honey strands into the
vidual portions.
This makes the machine suitable for mass production
tead of in small numbers. The honey is divided into ex-
ly equal portions in a hygienic way. 29.12.77 as 758643
to 2701765 (6pp39)

A- ★ D11 51176B/28 ★FR 2405-020
ding device for loaves into shelved wagons - for passage in
ups to subsequent treatment posts
CERALIMENT-LU BRUN 07.10.77-FR-030222
(08.06.79) A21c-15

er removing the loaves from their baking-tins they are
lected in batches and transferred to a selective elevat-
which stacks them in a trolley running on a guide rail.
ccessive loaves are placed across the conveyor belt and
me up against the stop in groups of the desired number.
e drop-door is operated by a photocell and closes behind
em. A pushing device with its blade transfers the group
the conveying belt which brings it to the stop.
Another photocell operates the pusher, with its blade,
d the group is moved into the chute which leads to the
atform of the lift. This platform can be aligned with any
elf in the wagon and the pusher, with its blade, sends
e group onto the programmed shelf while the latter is
ept in position by the rider operated by the motor.
The device is entirely automatic, it is capable of oper
ing rapidly in transporting the hot, fragile loaves in
roups, without damage, to wagons for passage to various
reatment posts. 7.10.77 as 030222 (6pp519)

MAED- ★ D11 51398B/28 ★J5 4067-068
Compsn. for bakery prods. - comprises flour, wheat starch, alpha-starch, dried egg powder, etc.
MAEDA SANGYO KK 04.11.77-JA-132886
(30.05.79) A21d-13

The compsn. comprises 40-45 pts. wt. flour, 6-8 pts. wt. wheat starch, 36-40 pts. wt. α-starch and 1-3 pts. wt. dried egg powder, as well as other additives such as emulsifier, soybean lecithin, casein sodium and table salt. The α-starch may have an α-conversion of 80-85%, the starch originating from corn, wheat, etc. The emulsifier includes propylene glycol fatty acid ester, glycerine fatty acid ester, etc.

In an example, 41 pts. wt. flour, 10 pts. wt. α-corn starch (<60 mesh), 28 pts. wt. α-wheat starch (<80 mesh), 6 pts. wt. wheat starch, 2 pts. wt. dried egg powder, 0.9 pts. wt. table salt, 1 pt. wt. emulsifier, 4 pts. wt. casein sodium and 0.1 pt. wt. soybean lecithin were homogeneously blended. 4.11.77. as 132886 (3pp22)

RIJK- ★ D11 52014B/28 ★NL 7714-214
Continuous rolling of layered dough - with rotating rollers on common pitch circle between two flanges with longitudinal mixing forces on dough eliminated to give leaf finish
MACH C RIJKAART BV 21.12.77-NL-014214
(25.06.79) A21c-03/02

Layered dough consisting of alternate layers of dough and butter or margerine is rolled to a desired thickness by means of a series of freely rotating rollers mounted on a common pitch circle between two flanges. The flanges are rigidly mounted on a drive shaft coupled to an independent drive, preferably variable speed. The layered dough passes between the rollers and a conveying roller. The conveying roller rotates at the speed required to give the desired dough discharge rate.

The multi-roller assembly rotates at a higher speed than the conveying roller, pref. of the order of 15 x as fast A shoe with an internal contour matching the outer trajectory of the free rollers is forced by means of a spring into contact with the latter rollers at a part of the trajectory where they are not in contact with the dough. This causes the free rollers to rotate in the opposite direction so that there is no net longitudinal force exerted on the dough layers as they are compressed together.

Device enables layered dough to be rolled without mixing the margerine with the dough thereby ensuring a good quality "flaky" prod. 21.12.77 as014214(8pp1370).

UVEN= ★ D11 52089B/28 ★SU -624-589
Dough blanks shaper for biscuit mfr. - has shaping mechanism at lower end of shaft rotating around given point during shaping
UKR VENDING EQUIP 28.02.74-SU-004722
(08.08.78) A21c-11

The dough shaper claimed in parent patent 456598, has a vertical rod to which the shaping mechanism was fastened plus an attachment for raising and lowering it. The shaping mechanism was made plate-like and attached to the rod by means of bearings at an acute angle to its rotational axis, as well as being connected to the raising and lowering attachment.

The shaping quality is improved by installing the container above the shaping mechanism so that it can interact with a bushing placed inside it and connected to the rod. This container can also move axially relative to the rod to ensure a controlled gap between the shaping mechanism and the dough blank; it also has a unit for fixing it in a given position.

Bondarenko, V.V., Kaban, V.N., Sultankhodzhaev, A.S. et al. Bul. 35/25.9.78. 28.2.74 as 004722 Add to 456598 (3pp29)

FRRR D11 90091Y/51 =US 4159-348
Baba type fancy cake - comprising cellular bread allowing greater alcohol impregnation
FERRERO P & CIA SPA 07.06.77-IT-068308 (17.08.76-IT-069028)
*(26.06.79) *BE-857-760 A21d-13/06 +A21d-15/08*

A pocket-size cake prod. is produced comprising a pref. parallelepipedic portion of bread component completely enrobed with chocolate and impregnated with a spirituous sugar-contg. liqueur, in amt. $\geqslant$ 1 wt. part liqueur to 1 wt. part bread component.

Liqueur provides $\geqslant$ 35 ml. ethanol and $\geqslant$ 25 g sugar in each 100 g of bread component. Chocolate contains $\geqslant$30 wt. % of edible fat. Bread component has a prevailingly cellular structure contg. closed cells. Bread component portion contains 2 layers bonded together by a layer of cream.

Pocket cake can be prepd. commercially from a bakery dough, which is raised, then baked, impregnated with the liqueur, severed into portions, then enrobed with chocolate. 29.7.77 as 820184 (6pp931)

CAIE/ ★ D11 52476B/28 ★US 4159-349
Cheese topping for pizza pie - comprises slices which cover pie shell and food items and have apertures for venting of vapour and juices
CAIELLO J A 31.10.77-US-847199 (09.11.76-US-740288)
(26.06.79) A21d-13

A pie comprises a pie shell having a peripheral regi food items covering the shell up to the region and inc a sauce emitting vapour and juice upon heating. A ch topping is provided on the food items and comprises egral slice of pizza pie topping cheese which extends the peripheral region. The slice has several apertu for releasing vapour and juice from the food items an sauce.

The cheese topping may also comprise two semici slices or four geometrically congruent slices instead single, integral slice, and the slices, extend to the pe eral region and cover all the food items.

Used in pizza pie manufacture. The cheese toppin of uniform thickness except at the aptertures, and tex No grinding or grating of cheese and measurement of ed cheese is necessary. The apertures provide vents juices rising from the food items during baking and el ate bubbling up of the layer of cheese. The time for ing pizza pies is reduced and no obnoxious odors from en off and burnt cheese result through the use of the l (s). 31.10.77 as 847199(22pp1044)

UNIC ★ D12 50861B/28 ★BE -872-822
Cellulosic casing for foodstuffs partic. sausage - has interior coating of cellulosic ether and cationic resin
UNION CARBIDE CORP 15.12.78-BE-872822
A97 (A11) (15.06.79) A22c C08j

A cellulosic casing (possibly crinkled) has an interior coating composed of a water-soluble cellulosic ether and a cationic thermosetting resin which is water-soluble or dispersible, but which by crosslinking becomes water-insoluble. The casing can enclose a fibrous sheet, and can also contain a mineral oil, a polyol, or the water-soluble addn. product of an al kylene oxide and a partial ester of a fatty acid.

The cellulosic ether is pref. a (hydroxy)alkylcellulosic nonionic ether or an anionic cellulosic ether, being partic methylcellulose, hydroxypropylcellulose, hydroxypropylmethylcellulose, ethylmethylcellulose, hydroxyethylcellulose, ethylhydroxyethylcellulose, carboxymethylcellulose or carboxymethylhydroxyethylcellulose. The resin is pref. the reaction product of epichlorhydrin with a polyamide, a modified melamine with formaldehyde, a modified urea with formaldehyde, or a polyalkylenepolyamine or one of its salts.

The coating causes the casing to adhere to foodstuff, but to be easily detached from it, and does not cause excessive exudation of fat. 15.12.78 as 872822 (27pp1331)

A meat mincing machine has a perforated disc with a ral groove on the side facing the cutters which is wide than the dia. of the perforations. The groove termina at the centre in a tangential direction in an axial blind bore of somewhat larger dia. This forms around the of the worm of the mincing machine an annular pocket the collection of any bones, contained in the meat.

Experience has shown that the pocket needs clearin out only every two hrs. It minimises the passage of t bone substance with the meat, and reduces the loss of eful meat. 29.10.76 as 649305(5pp39)

Shaped component length-measuring device - has sensitive helical strip element which rotates across line of object conveyor, used in automatic machinery adjustment

FAR EAST POLY 14.02.77-SU-452946

R11 (08.08.78) A22c-25 G01b-05/04

Device for measuring the length of objects, as used during the automatic adjustment of working units in a variety of technical machines.

It consists of a conveyor, recording apparatus, and, mounted in the plane of the conveyor and above it, a rotating spindle to which a helical strip is attached for use as a sensitive element.

To use the equipment for measuring the length of cylindrical objects of different diameter, plus objects of conical shape, a U-shaped guide is attached, with the spindle bearing the sensitive element being kinematically connected to the conveyor and positioned at an acute angle to its longitudinal axis. One end of the spindle is held by a pivot and the other is connected to the recording apparatus, located in the U-shaped guide and being able to move freely.

Decaffeination of coffee - by treatment of thin film of aq. soln. with carbon di:oxide
STUDIENGES KOHLE MBH 17.05.78-US-906882 (13.02.78-US-877535)
(29.05.79) A23f

The surface of a thin film of an aq. soln. of coffee extract is treated with CO_2 at super-critical temp. and pressure conditions. By this means the caffeine is removed, leaving an aq. soln. free of caffeine. The aq. soln. pref. contains 20-40 (25-38) wt.% dissolved coffee solids. The CO_2 temp. is pref. 32-140°C, and pressure 75-350 bars. Treatment with CO_2 is pref. effected by passing the soln. from the top to the bottom of a packed column against a counter-current of CO_2. The caffeine can be isolated by sepn. of the CO_2 by expansion, and distn. of the caffeine soln. TheCO_2 can be recycled.

Decaffeination is carried out without requiring the prior removal of substrances imparting taste and smell to the coffee (and their subsequent re-introduction). The method is simple and short. 13.2.79 as 874137 (12pp1331)

lting whey using anionic and cationic exchangers - in hydrogen onate and ammonium form respectively, then regenerating

VENSKA MEJERIER 10.05.77-SW-005424

*(26.06.79) *BE-866-763 A23c-21 +A23c-09/14*

Whey is desalinated using anion and cation exchangers by passing whey through a weakly basic anion exchanger working in hydrogen carbonate form so the anions in whey are exchanged for HCO_3 ions, and then through a weakly acidic cation exchange working in NH_4 form so the cations in whey are exchanged for NH_4 ions.

The ion exchangers are regenerated by treatment with NH_4HCO_3 soln. The ions in the whey are removed by evapn. as CO_2NH_3 and water vapour. The capacity of the ion exchanger is restored no more often than every second cycle by treating with an acid and then an alkali.

Process is continuous and less polluting and a high desalination is achieved. 3.5.78 as 902532(6pp982)

Treatment of aq. waste materials - by nitrification, denitrific
nitrogen desorption, and oxygenation
BOC LTD 21.11.78-GB-045441 (12.09.77-GB-037976)
(11.07.79) C02c-01/17

Aq. waste material is treated by the following cyclica
sequential process: (a) N-contg. cpds. in the waste ar
oxidised to nitrates by nitrifying micro-organisms; (b
nitrates in the aq. waste are then reduced to N_2 by an
ically denitrifying microorganisms; (c) N_2 is desorbed
extrd. from the aq.; and (d) the aq. material from wh
N_2 has been extrd. is oxygenated, then a portion is recycled to the oxidising region.

Step (a) nitrification is typically effected by the acti
vated sludge method, and is e.g. performed in a vess
which the sludge is allowed to settle towards the botto
and an upper layer of relatively clear H_2O flows away
Nitrified liq. is withdrawn and mixed with fresh aq. w
material. Step (b) denitrifiation is pref. in a closed ve
in which the aq. waste is passed through spaced, verti
sheets of mesh or guaze. In step (c) N_2 (and some CO_2

removed typically by a vacuum pump. Step (d) oxy-
on is pref. with a gas contg. $\nless$ 80% by O_2, esp. with
ercial pure O_2. The gas is added to a down flowing
of the aq. material with turbulence, and the velo-
the aq. stream is reduced sufficiently so that the
bubbles rise against the direction of flow and pass
the turbulent region.
thod is suitable for the treatment of sewage. 21.11.

atment of waste waters from foods mfr., fermentation
licine treatment, etc., contg. protein, amino acids,
charides, etc., is claimed, using a membrane separa-
method. Waste water is first filtered through a filter
dium of Cu metal having a great number of lattice de-
ts, e.g. Cu fibre, (un)woven fabric, Cu wire netting,
web laminate, electrolytic Cu foil laminate, electroly-
Cu powder, etc. The filtrate is then subjected to a
mbrane sepn. using reverse osmosis appts., ultrafiltr-
on appts, micro-filtration appts., or a combination of
se.
Method is capable of preventing the growth of micro-
ganisms because microorganism present in liquor to be
ated are killed by passage through the copper filter
dium, thus preventing the lowering of the filtering capa-
ity of semipermeable membrane due to the adhesion
d attack of microorganisms. 15.11.77. as 137491 (4pp

Activated sludge treatment to eliminate phosphates - by mixing with sludge and aerating
UNION CARBIDE CORP 04.09.73-US-394340
*(20.06.79) *DT2442-031 C02c-01/06*

An activated sludge treatment eliminates phosphates from sewage by mixing with sludge and serrating until the microorganisms have absorbed phosphates. The phosphates are released in a settling zone contg. an anaerobic sludge layer. When the soluble phosphates have migrated into the upper part of sludge to form a liquid layer, this layer with its phosphate content is removed and the low-phosphate sludge is recycled.

The phosphates are released and the high-phosphate aq. phase is sepd. from a low - phosphate sludge directly in the settling zone. This saves the time and the appts. for the separate treatment of a high-phosphate sludge. 4.9.74 as 100976 (clg. 4.9.73 - US - 394340) C02c-1/06 (20.6.79) UNION CARBIDE CORP (3pp)(J50072453)

Electric power-station condensate deaerator and supply unit - has tank and column with pipes at certain levels for taking away the deaerated water for economy
URALS BR THERM TECH 24.01.77-SU-445443
Q72 (26.07.78) C02b-01/10 F22d-11/02

The deaeration and supply installation, operating with sliding steam pressure, comprising a deaerator with tank and deaeration column, feeder pump, feed water cooler, and pipelines connecting the pump with the tank and cooler, and the cooler to the de-aerator.

Operational reliability and economy are increased, by sub-connecting the pipelines linking the cooler with the deaerator to the tank and deaeration column at the points of permissible liquid levels. Superheated steam is fed directly from the uncontrolled outlet from the turbines into the de-aeration column, the pressure changing with the alteration in load. The level of the water in the de-aerator tank alters correspondingly. With the abrupt reduction in load the steam pressure drop is particularly intense, since the temp. of the water collecting in the tank is so much lower. Kondratev, A.D., Oprishchenko, B.G., Kurnyk, L.N. et al. Bul. 34/15.9.78. 24.1.77 as 445443 (3pp29)

Animal farm manure dewaterer - has reciprocating mesh screen vibrating inside container to which manure is fed and through which liquid filters, used in fertiliser mfr.
UKR AGRIC MECH ELEC (ZAPO=) 04.03.77-SU-459515
P11 (08.08.78) A01c-03 B01d-25/04

The power consumption of the dewatering process is reduced by installing the screen so that it moves backwards and forwards in the horizontal plane, using a torsional vibration mechanism, e.g. a crankshaft drive.

As the screen oscillates, the liquid manure is piped to the space enclosed between the body and the screen. As result of the reciprocating motion of the screen, in the liquid mass close to the screen's surface, a pulsating centrifugal force is generated, varying from zero to maximum value.

Composting appts. with upper and lower chambers - separated by perforated plate through which solids are carried by added water
SUNDBERG H M 24.11.77-SW-013285
+P28 (25.06.79) A47k C05f-03/06

A closed housing has a top inlet, a cavity for waste, and a fan. The cavity is split into upper and lower parts by a perforated plate. The size of the holes in the plate is such that solids can pass through the plate only if they are washed through the holes by water.

The water is supplied either through the top inlet or through a nozzle in the top of the housing. The water collects in a trough covered by a strainer, and flows away through a pipe. 24.11.77 as 013285 (-pp1407)

Mfr. of Streptomyces protoplast which regenerates viable cells - by forming protoplast during transition phase of growth of organism
ELI LILLY & CO 01.07.77-US-812084
*B04 (26.06.79) *BE-868-472 C12k-01/02*

Streptomyces protoplasts are obtd. which are capable of efficiently regenerating viable cells. Streptomyces cultures are grown in the transition phase between the exponential and stationary phase, then forming the protoplasts.

Pref. the additional step of regenerating viable cells from the protoplasts formed is employed. Streptomyces species used are those able to produce antibiotics, esp. aminoglycoside antibiotics, macrolide antibiotics, betalactam antibiotics, polyether antibiotics or glycopeptide antibiotics.

Protoplasts obtd. by this method enhance the use of protoplast-fusion techniques to effect genetic exchange within the genus Streptomyces, and facilitating the construction of hybrid or recombinant strains which produce novel metabolites with useful properties. 1.7.77 as 812084 (5pp931)

Continuous sugar centrifuge - having sylindrical sieve drum eccentrically mounted in rotor rotating about main axis

MASCH BUCKAU WOLF R 03.02.73-DT-305326

*P41 (05.07.79) *DT2305-326 B04b-03/04*

A screen centrifuge, for the gentle treatment of crystallised sugar, consists of a rotor in which an eccentric perforated basket is driven independently from the rotor by a pinion on the central worm drive. The worm conveyor is housed in a hollow shaft for the rotor, with a slot and a scraper which contacts the inside of the perforated basket. The worm conveyor is driven at a differential speed to the rotor and contacts with its periphery the inside of the basket to remove the crystallised sugar layer.

The crystals are thus discharged in an area of little acceleration and velocity and retain their shiny appearance. 3.2.73 as 305326 (5pp39)

Stabilisation of fungicidal bis tri:alkyl tin oxide - by addn. of oxy:fatty acid ester
SANKYO ORGANIC CHEM KK 09.11.77-JA-133631
A60 C01 E12 (05.06.79) C07f-07/22

An oxyfatty acid ester is added to the bis-trialkyl tin oxide of formula (I): $(R_3Sn)_2O$ (where Ris 1-6C alkyl). (I) shows excellent fungicidal effect and has been used as antiseptics for paper, leather, paint and plastics and as agricultural fungicide and antiseptics for wood. (I) is obtained by alkali hydrolysis of trialkyl tin halide but is unstable, and is decomposed during storage when exposed to light or UV rays. The present method stabilises the active component (I) for a long period of time.

Examples of (I) are bis-trimethyl tin oxide, bis-triethyl oxide, bis-tri-n-propyl tin oxide, bis-tri-n-hexyl tin oxide, etc. Oxyfatty acid esters include, e.g., methyl glycolate, ethyl glycolate, propyl glycolate, butyl glycolate, hexyl glycolate, octyl glycolate, methyl lactate, ethyl lactate, butyl lactate, hexyl lactate, methyl glycerate, ethyl glycerate, butyl glycerate, octyl glycerate, dimethyl malate, diethyl malate, trimethyl citrate, triethyl citrate, etc. The addn. amt. is 0.1-5.0% of (I). 9.11.77. as 133631 (4pp108)

Granulometric analysis of foreign body content of liquids - involves thorough purification of cellulose ester filter with aq. acetic acid

DANILOV V M 24.06.75-SU-148861

A88 J04 R16 (A11) (09.08.78) G01n-15

The Foreign body content of liquids e.g. lubricants can be determined by passing the liquid through a porous cellulose ester membrane. Then this filter is cleaned and the particles filtered out are recorded conventionally. Now for greater accuracy, the filter is cleaned fully by using aq. acetic acid at 18-20°C for 1-2 min. Thus the filter is completely translucent to assist counting and measurement.

In the granulometric analysis the particles held by the filter can readily be examined under a microscope. A considerable increase of the fine fraction (0.5-5.0 um) is observed.

Danilov, V.M., Skorobogatova, A.N. Bul. 35/25.9.78. 24.6.75 as 148861 (2pp840)

OREA ★ D25 50873B/28 ★BE -873-315

Cosmetic skin cleaning compsn. - oil-in-water emulsion contg. a kaolinite clay

L'OREAL SA 06.01.78-LU-078831

(05.07.79) A61k

The compsn. comprises an oil phase, a water phase, an emulsifying agent and a mineral phase, which consists essentially of a kaolinite clay of particle size $< 60\ \mu$ with $\leqslant 25\%$ of the particles being $\geqslant 2\ \mu$. The clay has a quantz content $< 20\%$ and a thixotropy of $\leqslant 6$.

The compsn. is esp. used for removing make-up. It is non-irritant, leaves a soft and supple sensation, and unlike previous compsn. does leave a feeling of dryness. It is removed by washing. 5.1.79 as 873315 (9pp597)

UNIL ★ D25 50886B/28 ★BE -873-366

Aq. liq. detergent compsn. free from active salt additives - contains mixt. of three specified nonionic surfactants

UNILEVER NV 09.01.78-GB-000656

A97 (A25) (09.07.79) C11d

The compsn. contains 25-45% of a nonionic surfactant mixt. comprising (a) 50-80% of a 16-19C primary satd. alcohol/15-90 mals ethylene oxide condensate; (b) 5-25% of an 8-12C primary satd. alcohol/6-10 mols ethylene oxide condensate and (c) 5-25% of a 10-14C primary satd. alcohol/10-14 mols ethylene oxide condensate. The percentages are based on the sum of (a), (b) and (c).

The compsn. has a good detergent power at low temps. esp. for removing greasy stains, and unlike previously proposed compsns. does not gel or solidify at low temps. and is only slightly foaming. 9.1.76 as 873366 (7pp597)

Alkylation of benzene with olefin yielding mono alkylate - for detergent production

UOP INC 23.03.67-US-625495

*E14 (05.07.79) *GB1178-952 C07c-03/54 C07c-15/02*

Alkylaromatic hydrocarbons, used for producing easily biologically degradable detergents, are produced by alkylation of benzene with 10-15C n-olefins in the presence of HF in 2 alkylation zones in which the effluent from the first alkylation zone is sepd. into a first catalyst phase (I) and a first alkylaromatic hydrocarbon phase (II), at least part of one recycled and (II) passed to a second alkylation zone and alkylated in the presence of fresh or regenerated HF and from the effluent of which the alkylaromatic hydrocarbon phase recovered.

The first alkylation is carried out at 4-49°C with a dwell time of 5-25 mins. in the presence of $\geqslant 83$ wt.% HF and utilising > 98 wt.% of the olefin feed. The second alkylation is carried out at 27-66°C with a dwell time of 5-25 mins. in the presence of 93-100 wt.% HF, the temp. in this zone being $\geqslant 3.6$°C higher than the first zone. This gives a purer prod. (i.e. only small quantities of tarry impurities are formed in the catalyst phase). 22.3.68 as 768021 (6pp922)

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

APPENDIX 1

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distingu accepted West German specifications (DAS) from unexamined applications (OLS) which are given the nc DT code. in the case of Japan J5 represents unexamined applications, and J7 the examined of present series.

Basics Abstracts Journals

Twelve separate journals are published each week corresponding to the twelve sections of the CPI classification, the abstracts being arranged in accession number order. Abstracts are published in the BAJ for each section in which they have been classified. The abstract is a summary of around 300 words, where necessary with drawings, the abstract being arranged pictorially and broken down for ease of scanning into a number of paragraphs. The first defines the scope of the invention and there are special headings for uses, specifically claimed features and examples. Details relating to patents of addition/division; full patentees; and omitted multiple priority details are inserted at the beginning of the abstract.

Abstracts for South African and Swedish patent applications, together with abstracts for Japanese applications having foreign filings, appear for the first time once a full documentation abstract is available so that no delayed notification is now used. The Complete Specifications for such South African and Swedish patents are included in the Complete Specification Service for the week in which the documentation abstract is published.

Any abstracts requiring substantial correction are re-issued as located or notified, and mounted at the end of the current week's abstracts, separated by a 'flag' on which are listed the re-issued abstracts, with any changes of classification which have been required. The last serial number assigned to each Company Card set is shown at the bottom of the Sectional 'Flag'. The Company Card set comprises the full range of current and re-issued abstracts together with any repeat multipatentee abstracts.

Section N manual codes, which relate to Catalysis, appear on each appropriate abstract. The section N manual code index is bound into the Catalyst Profile Booklet, number 21.

Typical Abstract Heading

An explanation of the various flagged descriptors is given in Instruction Manual 1A — CPI/WPI User Aid.

EUROPEAN PATENTS REPORT
PCT PATENTS REPORT

New publications in the World Patents Abstracts service provide detailed, documentation-type abstracts, with drawings, of **all EPO and PCT** applications within **14 days** of publication. Also reported with the **designated states**, and references cited in the **international search report.**

Annual subscription costs :—
European Patents Report : £250, $525 or Y 95,000
PCT Patents Report : £100, $210 or Y 38,000

As support documentation the abstracts and complete specifications are available on **microfilm.**
Descriptive brochures giving complete price list, and specimen copies, are available on request from the Subscription Department.

D1: FOOD; FERMENTATION

D11 : BAKING

D11 25791U/19 =DS 2152-11
r an instant torte base - of sugar coated bread/cake crumb
drophilic binder
VELACK O NACHF (SUW -) 20.10.71-DT-152118
*12.07.79) *DT2152-118 A21d-13/08*

mb compsn. for 'instant' bakery products, esp. flan , is made by mixing 0.3-0.8 pts. wt. sugar with 1 p rumb, heating till the sugar melts onto the crumb, ng till the required colour has been attained and then ng the product with a hydrophilic binder based on star- rragbeen and/or alginates.

his facilitates packaging and transport and the selection e flan base size required. 20. 10. 71 as 152118 (3pp92)

D11 45955A/26 =DS 2656-56
g oven with cooling air conduits - has fume discharge in
ng air outlet above casing
OSCH-SIEMENS HAUSG 14.12.76-DT-656565
*74 (12.07.79) *DT2656-565 F24c-15/20*

ush-to-wall fitting electric cooker is surrounded betw its heat insulation and the carrier frame by cooling air nels. The cooling air is collected by a fan across the top of the muffle and blown into a divergent shallow nel across the oven top which emerges above the oven . The vapours from the oven are extracted by a pipe ch terminates in the wide part of the shallow channel re a deflector plate directs the air stream past its que outlet opening.

This removes vapours effectively without risk of their densation. 14. 12. 76 as 656565 (4pp39)

RN D11 49266B/27 =EP ---2-70
tideck baking oven - with cut/off valve for one deck coupled to
ught control throttle in waste gas flue
WERNER & PFLEIDERER 23.12.77-DT-757618
*+Q73 Q74 (11.07.79) *DT2757-618 A21b-01/40 +F23n-03/02*
F24c-15/32

S: E(BE, DT, FR, GB, IT, NL).

multi-deck baking oven with circulating hot gas is uipped with a shut-off device for the gas flow to one ck and with a throttle valve for the induced draught ntrol. Shut-off and throttle valve are actuated by a mmon linkage in such a way that opening of the shut f valve closes the throttle, and vice versa.

Provides a simple way of adapting the combustion nditions to the connection of disconnection of one deck. .12.78. as 101607 (8pp39).
G) ISR: FR-576945; DS-139367.

AKP ★ D11 53118B/29 ★GB 1548-958
atch preparing dough for biscuit making - the ingredients being
eheated to reduce the batching time
BAKER PERKINS LTD 12.10.76-GB-042352
(18.07.79) A21d-08/02 B01f-07/02

atches of dough for biscuit making are prepared by pre- ating the ingredients to such a degree that the dough aches the required condition in five minutes or less. ref. only the liq. ingredients such as the water or a soln the sugar in water, are preheated. A quoted preheating mperature for dough suitable for making Rich Tea and ce biscuits is about 30°C.

The short batching time enables more batches to be ade and ensures dough from a fresh batch will be avail- ble at short regular intervals. 11.10.77 (7pp525).

HIM- ★ D11 53252B/29 ★J5 4070-447
reparing noodle-like foodstuff - by adjusting moisture content of
ough contg. rice powder, shaping dough and steaming for
elation
SHIMADAYA HONTEN KK 10.11.77-JA-135129
(06.06.79) A23l-01/16

(a) adjusting the moisture content of powder and $<$50 w/w% of starch or starchy material other than rice powder, of which 1-40 (3-25) pts. wt. is either previously α-lyzed dry starch or starchy material or hydration-heated pasty starch or starchy material, to 35-55 (40-50) w/w%, (b) forming the dough into the form of the final prod. or into a flat sheet which can be cut into a final prod; and (c) steaming for gelation.

The dough can be readily formed into noodles using a conventional noodle-preparing machine. 10. 11. 77 as 135129 (4pp5)

SHIM- ★ D11 53253B/29 ★J5 4070-448
Noodle-like food prepn. from rice powder and starch - where tackiness of dough obtd. is reduced by incorporating additional starch powder, for simplified processing
SHIMADAYA HONTEN KK 10.11.77-JA-135130
(06.06.79) A23l-01/16

The method comprises (a) adding 40-85 pt. wt. of warm water at temp. above the gelatinising temp. of starch, in 40-90 pt. wt. of the mixt. composed of 50w/w% of rice powder and balance% of starch and/or starchy material, (b) stirring the mixt., (c) cooling the mixt. to below the gelatinising temp. of starch, (d) adding 60-10 pts. wt. of the powder selected from starch and/or starchy material, (e) kneading the mixt., (f) forming thus obtd. dough in the form of final prod. or the flat plate which can be made to final prod. by simply cutting and (g) steaming for gelation.

The stickiness of the dough obtd. in (b) can be suppressed by combining the additional powder as in (d), and the dough can be easily processed to noodle using conventional noodle-preparing machine without spreading edible oil or powder. 10. 11. 77 as 135130 (3pp5)

SHIM- ★ D11 53254B/29 ★J5 4070-449
Prepn. of noodle-like food which retains softness - by treating mixt. of water, alpha-amylase rice powder and starch with steam
SHIMADAYA HONTEN KK 10.11.77-JA-135131
(06.06.79) A23l-01/16

The method is characterized compsns. (a) combining 85-120 pts. wt. of water and of α-amylase with 100 pts. wt. the mixt. of $>$50 pts. wt. of rice powder and below 50 pts. wt. of starch and starchy material, (b) spreading the obtd. thick emulsion in smooth flat vessel so that final product can be obtd. either directly or by simply cutting, (c) keeping the spread at $\sim$70°C for $>$ 30 seconds and (d) steaming at $\sim$ 100°C for $>$ 60 seconds.

Noodle-like food which can be kept soft for long time and can be taken without hydrating and heating is provided. 10. 11. 77 as 135131 (4pp5)

SHIM- ★ D11 53255B/29 ★J5 4070-450
Noodle-like food prepn. from rice - by adding hot water to mixt. of rice and starch, partially gelatinising shaping and steaming for gelatinisation
SHIMADAYA HONTEN KK 10.11.77-JA-135132
(06.06.79) A23l-01/16

Method comprises (a) adding 40-85 pts. wt. of hot water having a temp. above the gelatinising temp. of starch in 100 pts. wt. of the powdery mixt. of $>$50 pts. wt. of rice powder and $<$50 pts. wt. of starch and/or starchy material other than rice powder, (b) stirring the mixt. to gelatinise it partly, (c) forming the mixt. either in the form of final prod. or in the form, from which final prod. can be obtd. by simply cutting it and (d) steaming it for gelatinising.

Noodle-like food similar as boiled noodle is prepd. from rice powder using conventional noodle-preparing machine. 10. 11. 77 as 135132 (3pp5)

NIKK- ★ D11 53256B/29 ★J5 4070-451
Starting material for noodles - comprises corn starch, gluten, natural gum, table salt and flour
NIKKEN FOOD 12.11.77-JA-135904
(06.06.79) A23l-01/16

Corn starch is mixed with gluten or other viscous material, natural gum or other paste material, and a small amt. of table salt, and is then further mixed with flour in an amt. of half as much as the former mixt. The material is prepd. cheaply and easily. The resulting noodles have as good a taste and flavour as conventional noodles.

In an example, 45 pts. corn starch, 10.13 pts. hydrous glutene, 0.17 pts. gum, 28 pts. water, 1.7 pts. table salt and 15 pts. flour were mixed and blended. 12.11.77 as 135904 (2pp22)

SHIM- ★ D11 53257B/29 ★J5 4070-452
Prepn. of noodles contg. rice powder - includes immersing rice powder in water and adding flour in specified quantities
SHIMADA-YA HONTEN K 17.11.77-JA-137258
(06.06.79) A23l-01/16

In preparation of noodles except for Soba, rice powder is previously immersed in ⩾ 2 times its volume of water and the treated rice powder is, with or without the immersing water, added to flour in such an amount that rice powder is 1-50 wt.% relative to the flour, followed by conventional method for preparing of noodles.

The immersion of rice powder in water is conducted at 0-60°C for ⩾ 10 minutes. In the immersing water, there may be incorporated enzyme such as protease, cellulase, hemicellulase, amylase, etc. and also acidic substance, alkaline substance and antibiotic agent. The rice powder immersed in water is pref. subjected to homogenization before addition to the flour.

Rice powder can be used effectively in the preparation of noodles without impairing the taste and flavour of the noodles, and thus powder of old rice can effectively be utilised. 17.11.77 as 137258 (4pp22)

KANE- ★ D11 53719B/29 ★J5 4073-144
Packaged chinese noodles prepn. - by spreading water on raw noodle, steaming, placing in bags with high gas barrier resistance, adding ethanol and sealing bags
KANEBO SHOKUHIN KK 24.11.77-JA-141259
(12.06.79) A23l-01/16

Method comprises (a) spreading water in an amt. of ⩾5 (7-40) w/w% on the surface of the raw noodle of flour and starch, (b) steaming with the steam having pressure of 0.5-1.5 kg/cm^2 to moisture content >40 (45-50) w/w%, (c) putting the obtd. steamed noodle in bags prepd. of a material showing high gas barrier resistance, (d) dropping ethanol in an amt. of 0.5-4 (1-3) w/w% on it and (e) sealing the bags.

Bagged chinese noodle which is excellent in mould-proof property and retrogradation resistance and can be preserved for long time stably, is prepd. The chinese noodle is cooked easily in a short time by boiling, frying, etc. and the cooked noodle is excellent in taste and texture. 24.11.77 as 141259 (5pp5)

MORA- ★ D11 B/29 ★RU --66-845
Discontinuous belt conveyor for bakeries
INTR MORARIT PANIFI 09.11.73-RU-076594
(30.10.78) A21c-09

SHEF/ ★ D11 53962B/29 ★SU -603-161
Baking bread rolls using infrared heating - involves first heating the centre parts and then the peripheral parts as the rolls move through the oven
SHEFER I A 04.01.76-SU-310001
(25.03.79) A21d-08/06

Method for baking food prods. uses a series of infrared heaters which heat up different part of the baked objects. Bread rolls can be baked in this way by initially exposing the centre parts to the irradiation, and then heating the peripheral parts.

The process is done in two cycles. Max. radiation is directed perpendicularly downwards to remove the moisture in the form of steam from a deep layer, without exposing the peripheral parts. The intense sepn. of the moisture cools the surface, and the heat coming out during the intervals between the articles heats up the surrounding air. Secondly, the edge parts of the dough pieces are irradiated as the rolls move out of the field of greatest radiation, so that the energy is transferred from the point of greatest heating to the points of least heating, i.e. along a
direction of operation. Subsequent cycles heat up
lesser sections by radiation from short-wave irr
sources. The temp. variation proceeds in eleme
stages, i.e. in a continuous series of uniform sta
beginning to end.
Shefer I.A., Bul. 11/25.3.79 4.1.76 as 310001 (

ALTO- ★ D11 54329B/29 ★U
Tined muffin splitting device - with guide cams actuable
the tines to prevent splitting
ALTO CORP 08.11.78-US-958797 (01.11.77-US-847662)
A88 P62 (03.07.79) B26d-03/28 B26d-04/76

A muffin splitting device includes a conveyor upon
muffins to be split are fed between a pair of tined
arrangements. Each arrangement includes an en
chain which drives tine carrying carriages alongs
conveyor. A cam means deflects tines carried by
riages laterally through muffins on the conveyor a

Continuous feed device for meat-cutting unit - in which large lumps can be processed by including a circular knife to remove surplus meat in conveying screw
LENGD ROSREMMEKHPRO 25.03.74-SU-007669
(01.09.78) A22c-17

Device for continuously feeding lumps of raw meat to a cutting unit comprises a hopper screw and working cylinder with guiding ribs. The lumps of meat are fed uniformly and continuously without crushing by fixing a circular knife at the entrance to the working cylinder, so that a controllable gap exists between it and the screw.

The lumps of meat loaded into the hopper pass downwards to the head of the screw and thus fill the spaces between the turns of the screw. Parts of the lumps extend beyond the outer dia. of the screw and as they are propelled along the working cylinder, these parts enter the gap between the knife and the outer edge surfaces of the flights of the screw.

The excess meat is thus removed, and the main parts of the lumps are taken up by the ribs and conveyed to the cutting unit as the screw rotates. Thus because of the way the edges of the meat are removed early in the movement through the feeding mechanism, the supply of meat to the final cutting unit is not impaired in any way. This means that larger-than-usual lumps of meat can be processed without having to remove them from the smaller lumps.

Easily dispersible powdered hydrated emulsifiers - prepd. by spraying mixt. of water and melted emulsifier

SOUTHLAND CORP 21.12.77-US-862908

*E17 (D21 E12) (11.07.79) *US4159-952 B01f-17 +A21d-02/16 A61k-07*

D/S: E(BE, CH, DT, FR, GB, LU, NL, SW).

Prodn. of powdered hydrated emulsifiers is carried out by (a) melting a normally solid emulsifier, (b) injecting

in an amt. sufficient to provide 2-15 wt.% H_2O in product, and (c) spraying the mixt. through a nozz a cooling chamber maintained at a temp. below th of the emulsifier.

The products are suitable for use in the food a metic industries. They are obtained in the form to-handle powders with good self-emulsification p ties when added to water.

20.10.78 as 300525 (14pp367).

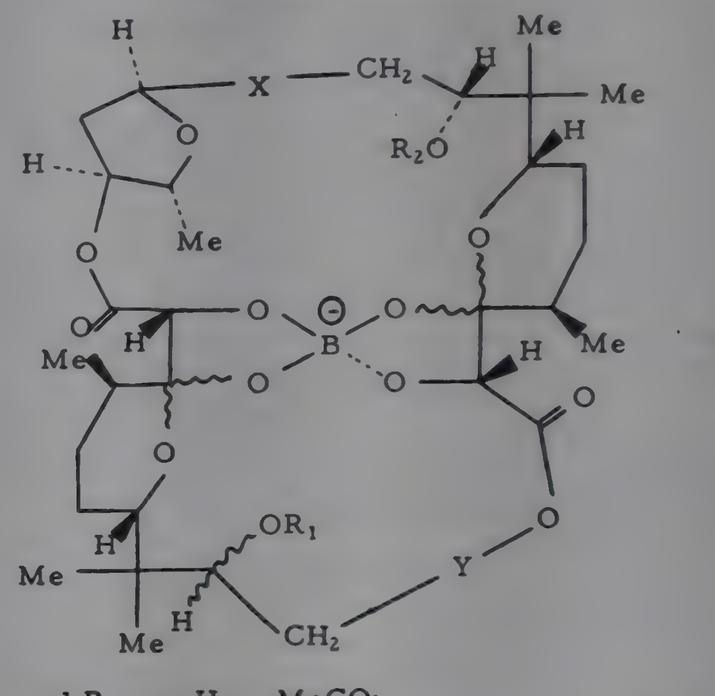
Treatment of ruminants with aplasmomycin or related modify rumen metabolism and to improve animal growth

IMPERIAL CHEM INDS LTD 08.05.78-GB-018269 (22. 053448)

C02 (11.07.79) A23k-01/17 C07d-493/22 C12d-09

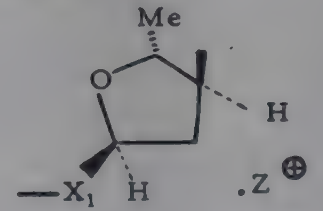
D/S: E(BE, CH, DT, FR, GB, IT, NL, SW, LU).

(A) Domesticated ruminants are orally given apla mycin or a related cpd. of formula (I):



(I

(R_1 and R_2 are H or MeCO;
either (a) the 3-, 3'- and 9'-C atoms are all in the figuration; X is CH_2CH_2 or trans-CH=CH; and Y of formula (II):



(II)

where X_1 is bonded to the CH_2 and the ring C is bo the O atom, X_1 being CH_2CH_2 or trans-CH=CH;
Z is Na, K, Li, Cs, NH_4 or $R_3R_4R_5R_6N^{\oplus}$;
R_3-R_6 are H or 1-6C alkyl;
(b) the 3-, 3'- and 9'-C atoms are all in the S-con tion; X is CH_2CH_2; and Y is a gp. of formula (III)

$$-CH_2X_2CH_2\overset{|}{C}HCHMeOCOCH(\overset{\oplus}{N}H_3)CHMe_2$$

(III)

$$-CH_2X_2CH_2\overset{|}{C}HCHMeOCOCH(NH_2)CHMe_2.Z^{\oplus}$$

where the CH_2 is bonded to the CH_2 in (I) and the C bonded to the O atom, X_2 being CH_2CH_2 or cis-CH or (c) the 3-, 3'- and 9'-C atoms are all in the S- uration; X is CH_2CH_2; and Y is a gp. of formula

$$-CH_2X_2CH_2\overset{|}{C}HCHMe\text{-}OH.\ Z^{\oplus}$$

(V)).

(B) Streptomyces griseus NCIB 11371 is new.
(C) (I) are new when (1) in gp. (a) one of X and X_1 CH_2CH_2 and the other is trans-CH=CH, or X and both CH_2CH_2; (2) in gp. (a) X is trans-CH=CH, X_1 trans-CH=CH and Z is K, Li, Cs, NH_4 or $R_3R_4R_5R$ (3) in gp. (b) Y is a (III) or (IV) gp. in which X_2 is

or $R_3R_4R_5R_6N$.
ruminants modifies rumen metabolism so that
on. of propionic acid formed at the expense of CH_4
acetic acid is increased, so that growth rate is
d, and food conversion efficiency is increased. (1

A92 (12.06.79) A23d-03/04 A23d-05/04 A23l-03/34

Method comprises packaging oily foods together with oxygen absorbent in an air-tight package prepd. of material which is oxygen impermeable and is made transparent, and UV-ray blocking at least partly by combining Ti oxide or iron oxide granules having particle size $<$ 200 mμ ($<$150 mμ).

As the material the complex film, of which inner side is made of polyolefin film and outer side is made of oxygen impermeable film such as the film of PVdC resin, acrylonitrile resin, PVA or EVA partly saponified resin, can be used. The film is made UV-ray blocking either by dispersing Ti oxide or iron oxide granules in the folm or spreading the adhesive or the coating material contg. Ti oxide or iron oxide granules on the film.

Oily foods such as potato chip, peanut, fried rice cake, etc. are not denaturated by oxidn. 18.11.77 as 139199 (5pp5)

TOPP ★ D13 53718B/29 ★J5 4073-140
Compsn. for keeping food fresh - comprises ascorbic acid and alkali carbonate
TOPPAN PRINTING KK 21.11.77-JA-139637
E13 (E34) (12.06.79) A23l-03/34

The compsn. contains ascorbic acid and alkali carbonate as the major ingredients. The compsn. prevents deterioration of foods by oxygen without giving harmful effects, ie. it shows absorbing ability for oxygen and the forming ability for CO_2 gas.

The amt. of oxygen absorbed and the amount of CO_2 gas formed can be freely controlled by regulating the proportion of ascorbic acid and alkali carbonate. To suppress the formation of CO_2 gas, $Ca(OH)_2$ may be (partly) substd. by alkali carbonate. The reaction can be promoted by using $FeSO_4$, $FeCl_2$, active C etc. as catalyst. 21.11.77 as 139637 (3pp5)

Refining sweet substance extracted from Stevia leaves - comprises treating liq. extract with aluminium magnesium complex oxide adsorbent
MARUZEN KASEI KK 18.11.77-JA-137963
B03 E13 (12.06.79) A23l-01/22 C07h-01/08

Method comprises treating the liq. extract obtd. by extracting the sweet substance from the leaves of Stevia rebaudiana Bertoni, with an adsorbent consisting of an aluminium-magnesium complex oxide.

The impurities in the extract can be removed in a short time with little loss of Stevioside. The adsorbent does not release ions which give harmful effect on the succeeding refining process using an ion exchange resin. The adsorbent can be regenerated. The refining method can be practiced in a closed system without discarding the waste.

The adsorbent can be prepd. by burning a mixt. of magnesium hydroxide and aluminium hydroxide at ca. 500-600 °C. It has the composition $MgO.\,xAl_2O_3.\,nH_2O$ ($x=0-0.25$), a specific surface area of 75-110 m^2/g and a void volume 18.11.77 as 137963 (4pp5)

Fodder additive for ruminants - contains sugar alcohols to
blood sugar level and milk yield (NL 21.9.77)
FARMOS OY 19.03.76-SF-000746
*C03 (28.08.78) *DT2710-930 A23k-01/14*

Fodder additive for increasing the blood sugar lev
milk yield of ruminants contains as active ingredi
5- or 6-valent sugar alcohol (I), specifically xylita
bitol, and/or dulcitol.
A suitable mixt. of (I) obtd. waste prod. during
xylitol from plant material comprises (dry basis)
xylitol; 20-35% arabitol; 10-25% mannitol; 5-15% s
5-10% dulcitol and 5-10% rhamnitol.
(I) improves the sugar balance in cows etc. in
the same way as propylene glycol, glycerine or pr
ates, so can be used to prevent ketonaemia during
of heavy milk prodn. (I) are only slowly digested
rumen and any which is digested in converted larg
propionic and not acetic acid.

having concentric rings of axial mixing elements - fo
ing aerated food and plastic prods.
KES E T LTD 10.03.78-GB-009674
J02 (02.07.79) B01f
comprises a cylindrical outer jacket with an end
with concentric rings of axial mixing elements. A
turns in the outer jacket and carries on its face other
g elements placed in several annular rings. The mi-
elements of jacket and rotor interlock with each other
are each formed by internal and external surfaces,
y cylindrical, and by straight surfaces forming the
of grooves of which the axes are placed following di-
nt tangents of an inner circle concentric to the partly
drical surfaces.
ixer may be used to produce aerated prods such as
, expanded plastics etc. The construction of the mi-
s such that all risk of the material talking a 'short
and missing the path through the mixing elements is
led. The inclined mixing elements exert a pumping
t. It is possible because of their structure, to reduce
xial length of the mixing elements. This allows for
ng the end walls, the rotor and/or the intermediate
by an injection moulding process in a plastic material.

ing and grinding appts. for various prods. - with central shaft
beaters running in squirrel cage with angled bars
UIGUE J P A 01.07.77-FR-020333
41 (15.06.79) B02b-03/04
lling and grinding appts. for various prods., such as
ee beans, consists of a central shaft with radial arms,
rying beaters or hammers, running in a fixed squirrel
e made from concentric rings fitted with parallel, equi-
ant bars.
Each hammer has a rectangular section and makes an
le of 20-50° with its arms, depending upon the prod.
g treated. Rings, arranged between the ends of the
ts., support the bars of the squirrel cage. Each bar has
shape of a rectangle and the edges are sufficiently
rp to start the rupturing of the shells surrounding the
ins to be treated.
The angle of incidence of the bars and their relative
cing and the speed of the hammers produce a more or
s speedy shelling of the grains and a more or less fine
nding of the prods.
The premature wear of certain zones of the cage can
ily be remedied by rotating it a fraction of a turn.

*A97 P34 +Q78 (03.07.79) *BE-855-511 +B01f-03/04*

A steam injector for heating flowable product, parti
in producing long-life milk, comprises a closed cha
holding a stack of flat discs between product inlet an
let with a pressurised steam space around the stack
disc has a central hole so that these define a central
age communicating with product inlet and outlet.

The planes of the discs is perpendicular to the fl
ection, and one face of each disc has non-radial cho
channels parallel to each other from disc periphery
central hole. The channels are offset from the radi
ords and steam is injected through the channels into
product in the passage. The discs are pref. of PTF
The injector can operate non-stop for 70-80 hr. 26.

ARIA/ ★ D15 52561B/29 ★BE -873-637
Prevention of corrosion and scaling inside water pipes - via appts. exposing water to electromagnetic field obtd. using direct current
ARIAS J V 25.01.78-DT-803066
(15.02.79) C02b

The device consists of a pipe fitted at each end with connecting threads or flanges so the pipe can be included in a water circulation system. The pipe is sorrounded by an electromagnet fed with direct current, whereas the pipe contains a support in which a diffuser is mounted. The diffuser consists of a shaft fitted with a helical blade and free to rotate in its support; the helical blade is on the outlet side of the pipe.

During the travel of the water through the magnetic field several of the physical and chemical properties of the water are altered, i.e. the sedimentation of crystals; the density; electrical conductivity; surface tension; solubility of salts; and the pH. These alterations prevent the deposition of scale and also cause the water to lose its corrosive properties; the result is that no chemical treatment of the water is required. 22.1.79 as 873637 (11pp1144)

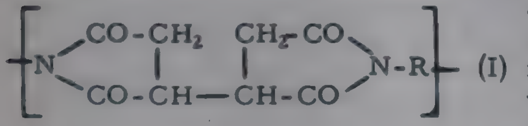
Selective permeability membranes - made by coagulating a heat treated film of a polyimide dope contg. an inorganic salt
NITTO ELECTRIC IND KK 10.01.78-JA-U01730
A88 J01 (A26) (12.07.79) B01d-13/04

Self supporting selective permeability membranes are made by first forming a dope contg. a polyimide polymer with repeating units in which R is a divalent organic gp; an inorganic salt; and a solvent capable for forming a homogeneous soln. with the other components. The dope is applied to a substrate to form a coating and the coated substrate is then heated to a temp. which does not cause the organic solvent in the dope to boil. The substrate is then coagulated in a coagulation medium.



(I)

The membranes have improved resistance to heat, alkalis, acids and organic solvents than prior art membranes. They are useful for reverse osmosis and ultrafiltration, e.g. to separate solvents from solns., emulsions and suspensions such as in the purification of effluent water and the desalination of sea water. 17.11.78 as 850043 (36pp513)

Unwanted slurried solids accumulated in a wet air oxidn. system for conditioning or oxidizing sludge are discharged using a flush water stream. The system includes a pressurized sludge flow through the cold side of a heat exchanger to the inlet of a reactor. The reactor effluent flows from the outlet of the reactor through the hot side of the heat exchanger to an adjustable pressure control valve. A normally closed, valved line communicates between the reactor bottom to a point upstream from the pressure control valve but downstream from the heat exchanger. After water has flowed between the heat exchanger and control valve the line valve is opened and the setting on the control valve is reduced to below the pressure in the reactor.

The accumulated solids can be periodically removed with only a temporary suspension of feed to the plant and without draining the entire liquid portion without having to cool the reactor contents.

Recovering fresh water using solar energy - by collecting water condensed on lower surface of transparent screen forming closed space over ground exposed to sun
TECHNIP 13.10.77-FR-030856
(15.06.79) C02b-01/06

A method of recovering fresh water by solar energy over an area exposed to the sun consists of placing over the area a screen which is impermeable to gaseous fluids but permeable to heat. The screen forms a closed space and its exposure to solar heat causes evapn. of the humidity present in the space. The humidity comes into contact with the lower surface of the screen, where it condenses and is collected by streaming under gravity, giving fresh water.

Used esp. for obtaining fresh water from salt water or brackish water contained in desert and sandy ground. 13.10.77 as 030856 (12pp1192)

*J03 (04.07.79) *BE-758-100 C02b-01/14 +C02b-03/10*

An aq. liq. contg. impurities is purified by passing the liq. between metal electrodes, to which an electric current is continuously applied to effect uniformly scattered emission of metal ions into the liq. The metal ions and hydroxyl ions of the aq. liq. cause the formation of fine floceulates in the liq.

The aq. liq. is then continuously circulated through a filter, comprising a preformed filtering mass within which the fine floceulates are deposited, retained and build up to form a porous filter mass. The filter is washed when the pressure drop for the aq. liq. passing through the filtering mass reaches a predetermined threshold value. The current applied to the electrodes is sufficient to provide metal ion emission at a rate such that free metal ions pass through the filtering mass with the aq. liq. to provide sterilisation of the filtrate.

Esp. used for purifying swimming pool water. 28.10.70 as 051321(5pp931).

NKYO ENG KK 17.11.77-JA-137252

07.06.79) B01j-01/09 C02c-05/02

kaline waste water recovered from the regeneration ss for anion exchange resin tower is neutralised by eral acid, e.g. hydrochloric acid, sulphuric acid, o pH 6-7. The acid waste water recovered from the eration process for cation exchange resin tower is eutralised by a basic neutraliser, e.g. caustic soda, d lime, etc. to pH 7-8. Both neutralised waste wat- re mixed together and then subjected to sedimentat- eatment.

e method reduces the amt. of sludge composed prim- of silicic acid, and therefore can treat the regenera- vaste water very easily. 17.11.77 as 137252 (4pp117)

Fresh water prodn. from sea water - in which water is pumped through a semipermeable membrane within a device attached to the bottom of a boat

SATO T 17.11.77-JA-138311

(07.06.79) B01d-13 C02b-01/82

Fresh water is produced from sea water by use of a semi-permeable membrane over a porous metal cap attached to a tube. The water is drawn through the memberane and the porous cap into the tube by a pump disposed within a sealed container (1) to which the tube is connected. The water is conveyed through a vertically extending tube into a vessel carried by a boat.

The container includes a number of such tubes and membrane covered porous caps and carries a weight for placing and maintaining buoyancy of the container-tube assembly in deep water.

There is no necessity for pressurising the sea water. 17.11.77 as 137311 (2pp47)

NITL ★ D15 53356B/29 ★J5 4071-099

Super-pure water prodn. - by evapn., ion exchange, etc., and filtration through copper or electrolytic copper powder or foil, etc., with many lattice defects

NITTO ELECTRIC IND KK 17.11.77-JA-138460

(07.06.79) C01b-05

The water first purified by evaporation, ion exchange, etc. until the concn. of impurities is lowered from the order of ppm to ppb; and then the water is brought into contact with a filter medium of copper material, electrolytic copper powder or foil, etc. having a large amt. of lattice defects, either by passage through the filter medium or by storage in a tank packed with the copper material.

This method not only gives super-pure water but also completely sterilises the water without damaging or fouling the water. The purified water is used in chemical industry, electronics industry, hospitals, etc. 17.11.77 as 138460 (2pp117)

KURM ★ D15 53434B/29 ★J5 4071-460

Dry treatment of sludge - by mixing with mineral acid and alkali in cruciform reactor, and removing evaporated water

KURIMOTO IRON WORKS KK 16.11.77-JA-137593

C04 Q76 (08.06.79) C02c-03 C05f-07 F26b-03/32

Method of treating sludge, e.g. organic sludges such as organic waste water sludge, sewage sludge, animal droppings sludge, etc. inorganic sludge such as lime industry waste water sludge, cement industry waste water sludge, fertiliser industry waste water sludge, etc. and pulp mill and fermentation waste water sludge, is described.

Sludge is mixed with a mineral acid, e.g. sulphuric acid, nitric acid, phosphoric acid, etc. and an alkali e.g. ammonia gas, liq. ammonia, NaOH, KOH, etc. in a cruciform reactor, and then water present in the sludge is evaporated by the heat generated by the reaction in the reactor and then the evaporated water is removed from the reactor.

Process can be used for the mfr. of a fertiliser and does not require any fuel or drier. 16.11.77 as 137593 (8pp117)

INOU- ★ D15 53494B/29 ★J5 4071-772

Recovering metal from waste soln. - by soaking diaphragm in soln., attaching electrodes to diaphragm and effecting cathodic deposition

INOUE KAGAKUSEIHIN 21.11.77-JA-138893

M28 (08.06.79) C02c-05/12

Process comprises (a) soaking diaphram in the soln. (b) attaching electrodes to both sides of the diaphram; and (c) depositing the dissolved metal on the cathode using an acid consisting of the anions of cpds. constituting the dissolved soln. or a mixed soln. of ≥1 metal salts constituting the acids and the dissolved soln. as the cathode.

Since the amt. of deposition can be controlled by the amt. of electricity, the compsn. of the soln. may be kept constant, by which a fine processing becomes possible. 21.11.77 as 138893 (4pp96)

KURK ★ D15 53495B/29 ★J5 4071-773
Treating large quantities of sludge - providing clean filter liq. and giving high dewatering efficiency
KURITA WATER IND KK 19.11.77-JA-138418
(08.06.79) B01j-01 C02c-03

Sludge-form liq. is introduced from supply inlets into a treatment chamber. Axially spaced fins are attached through spacers to a shaft which is driven from a motor, to form a filter element.

Adjacent filter elements are disposed to insert the fins of one element in clearances between the fins of other elements. Filter water is axially removed through holes of water-removable filter elements into a filter liq. chamber so that a sludge is transferred by water-unremovable filter elements to be discharged from a sludge outlet. The interval between the upper and lower filter elements is gradually reduced towards the sludge outlet. 19.11.77 as 138418 (5pp35)

DAIDO KAGAKU SOCHI 24.11.77-JA-141233

A41 E17 (12.06.79) C02c-05/02

An acidic organic waste liquor (resulting from the prodn. of methyl methacrylate) containing a large amt. of H_2SO_4, NH_4HSO_4 and methyl methacrylate oligomer etc. is treated simply and economically.

Method comprises (a) contacting with neutral phosphoric ester solvent to extract H_2SO_4; (b) treating the solvent with water to recover H_2SO_4, (c) sepg. reffinate into two portions; (d) adding alkali or alkali(ne earth) metal oxide, hydroxide or carbonate, e.g. NaOH, KOH, $Ca(OH)_2$, $Mg(OH)_2$, CaO, MgO, Na_2CO_3, K_2CO_3, $MgCO_3$, etc. to one of the portions in amts. of at least more than the equiv. w.r.t. NH_4HSO_4 contained to release NH_3 which is then absorbed in the remainder so as to be converted into ammonium sulfate. 24.11.77 as 141233 (5pp34)

Magnetic processor for water softening control - in which residual change of hardness is measured after water has passed through process object
TULA POLY 01.07.75-SU-145303
R26 (21.08.78) C02b-09 G05d-27

Control of a magnetic processor for water conventionally includes determination of the optimum gap field strength in the processor from the difference between the entry and the residual values of the measured parameter (hardness).

Now for greater effectiveness, the residual change of the parameter is measured after the water has passed through the process object as well as the processor.

The method is useful in natural water systems to reduce scaling in heat engineering. Use of the invention enables processor duty to be optimised to avoid scaling e.g. in a heat-exchanger. Heat exchange is increased and the lift of the heat-exchanger is prolonged.

The usual control system for treating water by a reactant contains a coagulent and acid dispensing system and meters for acid-base buffering and water colour. In this case the expenditure on coagulant and acid is too great.

Now a computer is introduced for greater economy and improved quality. The invention is useful in purifying industrial and public water supplies esp. in the chemical and paper-cellulose industries. The signals from the two meters are fed to the computer which calculates the requisite doses of coagulant and acid and forms corresponding signals. These signals. These signals are fed to the appropriate dispensing systems which also set the requisite dosage.

Batch process for continuous propagation of microorganisms - with supervision and control of long term cultures
SICK P 03.12.75-DT-554393
*(12.07.79) *DT2554-393 +C12b-01/10*

A device for the long-term cultivation of microorganisms has in the culture vessel a partition with a slot at the bottom which ensures that a fresh medium, admitted at the top, passes through the whole vessel. Excess medium and gas are extracted, and another metering pump adds inoculants. A pickup for a significant parameter feeds a gradient rise regulator and a control unit for a recorder. The control unit keeps the stirring mechanism at constant speed and controls all pumps.

This automates the complete process so that no supervision or interference by an operator is required. 3. 12. 75 as 554393 (7pp39)

Enzyme substrates are kinetically estimated by me
coupled reactions. The reaction parameters are c
so that the most specific part reaction determines t
te for the whole reaction chain, and occurs by a fir
pseudo-first order route. The reaction is followed
asuring a variation of a predetermined time interva

Pref. the rate limiting step is arranged by addin
ess of the enzyme(s) for the other part reaction(s),
choice of the enzyme for the most specific part rea
This can be achieved by artifically altering the Mic
constant (e.g. by changing the metal atom of the act
centre, partial cleavage of the enzyme, chemically
fying the active centre, and/or altering the conform
or altering the substrate (e.g. by complexing or mi
formation). In order to set up a pseudo-first order
ction, the second and further reaction partner (whic
not the same as the substrate or resulting prod. to
termined is used in excess.

Method is used for determing blood sugar, trigly
total cholesterol, or urea. Reaction is more rapid
'fined-value' processes, so that automatic equipmen
be used. 24. 12. 75 as 558536 (6pp913)

Air gap electrode for ammonium ion concn. determn. in aq. soln. - has a glass electrode, reference electrode and single electrolyt. immobilised in a gel
BRITISH PETROLEUM LTD 09.06.75-GB-024610 (09.06.75-GB 024609)
E35 J04 R16 (D15) (18.07.79) G01n-27/46

An air gap electrode has a single electrolyte, pref. an ammonium salt, which is unimobilised in the form of a ge , pref. agar, and comprises a glass electrode in contact with the gel, and a reference electrode, pref. an Ag/AgCl electrode. The electrodes are in electrical contact through the electrolyte in the gel.

The concn. of ammonium ions in aq. soln. is measure by alternately passing samples of a test soln. and a reference soln. both of pH7, to the ammonia-sensitive air-ga electrode, and measuring the potential differences induce . The potential difference of the test soln. is compared with a graph of the potential difference of the reference soln. and its ammonium ion conc. to give the ammonium ion concn. of the test soln.

The electrode can be used to measure the concn. of an ionisable gas in the soln. and/or to measure pH change due to the dissolved gas. It can be used in fermentation processes, effluent monitoring, sewage control and water quality control. The device avoids the prior art problem of maintaining a constant thin film of electrolyte on the glass electrode and limitations of response speed at the lowest concns. 27.5.76 (10pp976).

battery with aluminium (alloy) anode - contains ccharide, protein or aminoacid in electrolyte to reduce on of anode
MITOMO CHEMICAL KK 17.11.77-JA-138783
)L03 M26 R47 (07.06.79) H01m-06/06

ry battery has Al or Al alloy as anode, and an electe contg. polysaccharide, protein or aminoacid. Rate rosion of Al (alloy) anode is reduced by adding the ccharide, protein or amino acid to the electrolyte.

polysaccharide is amylose, agar, amylopectin, gum c or glycogen; the protein is actin, amylase, insulin, in or pepsin; the aminoacid is alanine, arginine, aspacid or glutamic acid.

pically, an Al alloy consisting of 3.0 wt.% Zn, 0.13 Zn, 0.001 wt.% Ga, 0.07 wt.% Bi and the balance Al. led and annealed at 400°C for 4 hrs. to form the anode. athode consists of Pt. The electrolyte consists of a % NaCl aq. soln. contg. 2 g/l of agar. 17.11.77 as 3 (3pp86)

Guanosine fermentation production - using adenine-requiring bacillus mutants resistant to sulpha drugs, methionine, methionine anologues or azaserine

AJINOMOTO KK 14.06.73-JA-067276

*E13 (27.06.79) *DT2428-548 C12d-13/06*

Guanosine (used as a starting material for the seasoning agent sodium guanosine 5'-monophosphate) is produced in improved yields by cultivating a guanosine-forming, adenine-requiring mutant of the genus Bacillus which is resistant to sulpha drugs, methionine, methionine analogues and /or azaserine under aerobic conditions in an aq. culture medium until guanosine is accumulated in the medium and recovering the guanosine from the medium.

Suitable Bacillus mutants are obtd. by subjecting a suitable parent strain to mutagenic doses of ionising radiation or chemical gents and isolating the desired mutants by appropriate screening procedures. The mutants used are pref. also resistant to 8-azaguanine. 14.6.73 as 067276 C12d-13/06 (27.6.79) AJINOMOTO CO. INC. (4pp) (J5 0013589)

Binder-contg. fibrous sheet mfr. - for sanitary towels, beverage containers, laminates
KROYER K 02.03.78-GB-008253
A81 F04 (02.07.79) B29j

The prepn. of fibrous products by dry deposition, comprises a gaseous medium contg. the suspended fibrous material across a gas-permeable shaping surface so as to form a fibrous sheet thereon. A binder is incorporated in the sheet by contacting the binder with the fibrous material before or during the formation of the fibrous sheet on the shaping surface.

Used for the prodn. of fibrous products where the ratio between the fibres and the binder varies between large limits. The fibrous products may comprise two or three fibrous sheets formed separately by separate fibre distributors. The sheets may be compressed to form sanitary towels and other body care products. 2.3.79 as 874567 (-pp004)

Disposable napkin folding into breeches - has strips at leg openings constricting elastically only when fluid is excessive
HARTMANN P AG 11.03.78-DT-810680
A83 F07 P21 (02.07.79) A41b

A disposable napkin folding into breeches for an infant or a sick person in bed or being transported, consists of an outer impermeable film, an absorbent wadding or pad of paper, etc. and a lining which is permeable to moisture and which is secured to the outer film along its edges. layer of elastic material is provided on the marginal zo of each leg opening.

The handicap of similar napkins that the legs of the w rer are constricted for the whole period of its use, so t the circulation may be obstructed, and the skin may be irritated, is eliminated.

The layer in the marginal zone of the leg opening is a strip of flexible material which in the dry state is inelas ic. It only becomes elastic when liquid tending to excee that which can be absorbed is present. It then tightens zones of the leg openings. 9.3.79 as 874726 (17pp1014)

Treating timber by diffusing in gaseous ammonia formaldehyde - which react to form hexamine which then with resin acids in the wood, esp. larch, to form resinate

KEN Y 10.11.77-JA-135157

A97 C03 F09 P63 (06.06.79) B27k-03/20

Method comprises firstly diffusing gaseous ammonia
then diffusing gaseous formaldehyde to the timber. B
this method ammonia and formaldehyde are condensat
polymerised in the timber to form hexamine. Thus fo
ed hexamine can react with resin acid in larch and the
med resinate is uniformly distributed and absorbed ar
fixed in the timber. Further, the ammonia reacts wi
phenol cpds., sugars, etc. in the timber and timber
glossy black colour can be obtd.

The method can be effected simply using gaseous p
agents without a special pressing device and is free o
ution problems. Hexamine exhibits antimicrobial effe
and the resinate-contg. treated timbers are resistant
cracking, warping, distortion, etc. Thus inexpensive
is improved to a high quality timber.

Specifically, gaseous ammonia is first diffused into
timber and the diffused ammonia promotes the diffusio
formaldehyde. After the diffusion the timber is heate
with steam and the resinate is liquefied and distribute
uniformly throughout the timber. 10.11.77 as 135157

Chemical steriliser for surgical instruments - has spring-loaded plates for raising and lowering basket into which the instruments are placed

MOROZ M A 31.01.77-SU-446695

P34 (21.08.78) A61l-03

Device for the chemical sterilisation of surgical instrumen-ts comprises a cylindrical vessel, inside which is a basket provided with an attachment for raising and lowering it. The sterilisation quality of the instruments is increased and convenience of use is guaranteed, by making the raising/lowering attachment as spring-loaded plates, one end of each of which is fastened to the basket, while the other end is shaped like a hook. On the outside walls of the plates there are extra hooks which ensure that the basket can be fixed on to the edge of the container.

free N-acyl taurine prepn. - by reacting taurine salt and acid ride in alkanol in presence of alkali metal hydroxide, sepg. . chloride, and cooling to ppte.

AF CORP 03.01.78-US-866284

60 E16 (11.07.79) C07c-143/67

: E(CH, DT, FR, GB, IT).

pn. of N-acyl taurine free from alkali metal chloride nprises (a) reacting, in a 1-4C alkanol medium (initially tg. $\ngtr$ 15 wt.% H_2O) at 30°C-reflux temp., 1 mole of a 2 C carboxylic acid chloride with 1 mole of a taurine t of formula (I):

$$HNR^1 - CHR^2 - CHR^2 - SO_3M \quad (I)$$

(where R^1 is H or 1-6 C hydrocarbyl; each R_2 is ep. H, Me or Et; M is an alkali metal) in the presence 1 mole alkali metal hydroxide; (b) sepg. the pptd. ali metal chloride while maintaining the temp. high ough to solubilise the N-acyl taurine reaction prod; and cooling to ppte. the N-acyl taurine.

N-Acylated taurines are anionic surfactants (Igepon-T; M) useful in liquid detergents, synthetic soap bars, thpastes, mould lubricants and emulsion polymerisation actions.

The process is easily controlled, is economical and ovides a prod. contg. $\ngtr$ 1.5% of salt. (The presence of lt in the surfactant is detrimental (e.g. corrosive, hygroopic) for most of the above applications.).

12.78 as 101520.(16pp960).

PROC ★ D25 52978B/29 ★EP ---2-857

Detergent article comprising surfactant mixt. on insoluble substrate - with improved release of active wash components and excellent soil removal from fabric

PROCTER & GAMBLE CO 23.12.77-US-864136 (23.12.77-US-864050)

A97 E19 (11.07.79) C11d-01/83

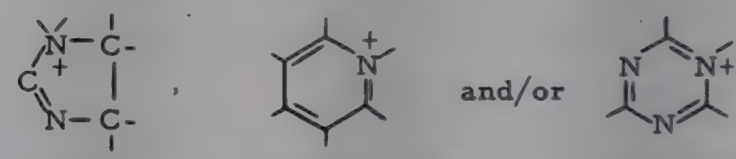
D/S: E(BE, CH, DT, FR, GB, IT, NL).

A laundry detergent article comprises a water insoluble, wet strength substrate carrying a detergent compsn. consisting of (a) 5-95, pref. 10-90 wt. % of a mixt. of (i) nonionic surfactant of HLB 5-17, (ii) cationic surfactant in a ratio of (i):(ii) of 5:3 to 300:1, pref. 5:3 to 50:1 and (b) 1-30% of a nonionic or cationic solubilisation aid of solubility in 100°F water of $\geqslant 20$ wt. % and which completely dissolves in 100°F water in $\ngtr 2$ mins.

The cationic surfactant is of formula:

$$R^1_m R^2_x Y_l Z$$

(where R^1 is a gp. contg. an alk(en)yl opt. substd. by $\leqslant 3$ phenyl gps. and opt. interrupted by $\leqslant 4$ gps. selected from $-C_6H_{10}-$, $-COO-$, $-OCO-$, $-CON(R^2)-$, $-N(R^2)CO-$, or $-O-$ and which contain 8-22C and may also contain $\leqslant 20$ ethoxy gps; m is 1-7 and $\ngtr 1$ R^1 can have $> 12C$ when m is 3 or more; R^2 is alkyl or hydroxyalkyl of 1-4C or benzyl with $\ngtr 1$ R^2 being benzyl; x is 0-7; remainder of any C, N, S or P atom positions being filled by H; Y is selected from $\gtrdot N^{\pm}$, $\gtrdot P^{\pm}$, $>S^{\pm}$, $\gtrdot N^+(C_2H_4O)_pH$, p is 1-20,



l is 1-3; Z is an anion. The surfactant is water dispersible in admixt. with the nonionic surfactant.

Improved release of the active wash components are released into the wash soln. with minimal bleeding of the active components through the substrate sheet. Excellent removal of particulate and greasy/oily soils from the fabric is achieved. The laundry article may also provide fabric static control, fabric softening and dye transfer inhibition.

Purifying alkaryl sulphonic acid - by washing with water then heating with olefin to remove residual sulphuric acid

EXXON RES & ENG CO 23.12.77-GB-053638

E14 (11.07.79) C07c-139/14 C07c-143/34

D/S: E(BE, DT, FR, GB).

Crude alkarylsulphonic acids (I) are purified by first treating with 1-30 wt.% (on alkylate from which (I) is derived) of water, adding $\geqslant 1$ wt.% (on alkylate) of an olefin (II) and, after removing aq. phase, heating at 100-150°C for $\geqslant 15$ min. (esp. at 120-140°C for about 30 min.).

Pref. (I) is an alkyl(20-30C)-aryl sulphonic acid. The olefin is pref. used at 2-10 wt.% and has mol.wt. 294-336.

(I) are used to make detergents and emulsifiers.

The process is esp. for purifying crude (I) contg. > 3 wt.% H_2SO_4 and made using oleum for sulphonation. Washing with water before olefin treatment reduces residual H_2SO_4 content and can obviate the need for washing with aq. HCl.

13.12.78 as 300810 (10pp1251).

Builder for detergents - mfd. by baking specified natural alumin
silicate to remove impurities, and grinding to specified particle s

HORI K 18.11.77-JA-138476
E33 (07.06.79) C11d-03/12

A builder for detergents is prepared by baking natural
minium silicate obtained from clay, i.e. saponite, a m
ber of the family of montmorillonite, having a crystal
cture of an asteroidal form, at 200-400°C to remove i
rities, e.g. sulphur, sulphur cpds. and organic substa
without causing the destruction of the crystal structure
then the baked clay is ground into fine granules of a gra
size of <10 μ.

The builder, using clay as raw material which is ea
available in large quantities, can be mfd. simply by ba
and grinding without the use of special facilities and tec
ology, and also exhibits a complete builder's function b
ause of its complete solubility in water, due to the fine
of <10 μ and without causing any pollution in water du
the dissolution of impurities, e.g. phosphorus, etc. in
blic water. 18.11.77 as 138476 (3pp117)

In Basic Abstracts Journal only

MANUAL CODE INDEX IN Basic Abstracts Journal only

At the start of each main group of codes, the manual code and its descriptor are printed in the middle of the column. Each sub-division of a manual code group appearing during the week is given, accompanied by its descriptor. All manual codes occurring during the week within each sub-division are then listed, with accession numbers posted against them.

In all there are about 3,600 manual codes in CPI, each one having an average of less than 200 documents assigned to it per year. The full classification is set out in the Manual Code Instruction Manual, which also contains a keyword index of terms for easy reference.

APPENDIX I

COUNTRY COVERAGE

"Major" Countries

Covered completely in CPI and WPI from the commencement of the service except: Research Disclosure 1978, Europe and PCT 1979, Sweden transferred from "Minor Countries" 1979. Average weekly numbers are listed alongside.

Fast publishing

Belgium	180	
Europe	150	
France	740	
Germany, W. unexamined	1050	
Japan unexamined	845*	
Netherlands unexamined	240	
PCT	40	
Research Disclosure	20	
South Africa	100	
Sweden	260	
United Kingdom unexamined	600	3325

Slow publishing

Canada	450	
Germany, E.	100	
Germany, W. examined	465	
Japan examined	340*	
Netherlands examined	60	
Soviet Union	1200	
Switzerland	260	
United Kingdom examined	300	
United States	1200	4375

*Only CPI coverage for Japan.

"Minor" Countries

Complete coverage, but only introduced during 1975, with exception of Italy 1978.

Fast publishing

Brazil	140	
Denmark	120	
Finland	60	
Norway	80	
Portugal	30	430

Slow publishing

Austria	125	
Czechoslvakia	180	
Hungary	35	
Israel	40	
Italy	155	
Rumania	25	560

MINOR AND MAJOR COUNTRIES

If the first publication of an invention takes place in one of the 'major' countries listed above, then this publication is called the basic patent, a WPI accession number is assigned, and this is used for all subsequent members of the family.

If, however, the first publication occurs in one of the 'minor' countries listed above, then the document is regarded as a provisional basic. No accession number is assigned, since an abstract is not provided. If this provisional basic is then followed by further family members also from 'minor' countries, these produce entries in the same indexes even though an accession number has still not been assigned.

However, as soon as a member of the family is published in one of the 'major' countries, then this is regarded as the first disclosure. An accession number is assigned, and will apply also to all the earlier members of the family (from the 'minor' countries). Hence it is possible to see, in Index V, entries where the basic has a later week number than some of its equivalents.

For CPI, if the first publication occurs in Sweden, South Africa or Japan — in the case of Non-Japanese nationals — then the document is treated as a provisional basic as outlined above. Other than for Japan where a heading is given, an Alerting abstract is included in CPI at this stage.

Subsequently, when a documentation abstract is available an accession number is assigned to the document and the abstract published in the BAJ and related products. Headings will be included in the Alerting Bulletins for Sweden and South Africa together with abstracts for the Japanese at this later stage.

Entries are included in WPI Gazettes at both stages. At the later stage both a basic and an equivalent heading will be given for each such patent number.

COUNTRY CODES

For patent number (not priority) purposes, DS distingui accepted West German specifications (DAS) from unexamined applications (OLS) which are given the no DT code. in the case of Japan J5 represents unexamined applications, and J7 the examined of present series.

Arrangement of Abstracts

See Appendix I for definition of 'Major' and 'Minor' Countries.

'MAJOR' COUNTRIES – An alerting abstract of every basic and examined equivalent document is provided except for equivalents from Canada, East Germany and Switzerland. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

A	Polymer Chemistry
A+	Polymer Applns.
AE	Polymer & General Chemistry
B	Pharmaceuticals
C	Agricultural Chemistry
D	Food, Disinfectants, Detergents
E	General Chemistry
E+	General Chemistry Applns.
F	Textiles, Paper, Cellulose
G	Printing, Coating, Photographic Chemistry

Copies of Specifications may be ordered from our PATENTS SUPPLY DIVISION.

EUROPEAN PATENTS REPORT
PCT PATENTS REPORT

New publications in the World Patents Abstracts service provide detailed, documentation-type abstracts, with drawings, of **all EPO and PCT** applications within **14 days** of publication. Also reported with the **designated states**, and references cited in the **international search report.**

Annual subscription costs :—
European Patents Report : £250, $525 or Y 95,000
PCT Patents Report : £100, $210 or Y 38,000

As support documentation the abstracts and complete specifications are available on **microfilm.**
Descriptive brochures giving complete price list, and specimen copies, are available on request from the Subscription Department.

D1: FOOD; FERMENTATION

D11 : BAKING

' ★ D11 54544B/30 ★BE -875-019
ıring layered paste for french pastry etc. - by incorporating
fat particles and repeatedly rolling and stacking layers
JLTHEEL J M 13.04.78-FR-011441
(16.07.79) A21c A21d

process consists in mixing a paste of flour, water, nd salt and forming a dough comprising a plurality of rimposed paste layers with interlayers of fat. The n the form of solid particles is incorporated in the h. The paste is alternately rolled to a sheet form. sheets are then stacked to several thicknesses to lead gressively to a dough with alternate layers of fat and e.

he paste is used to make french pastry and similar tries. The above enables a homogeneous regular struc- on cooking. It avoids the large amt. of layering pre- isly required and the waiting time required between ering cycles. 22. 3. 79 as 875019 (10pp597)

W- ★ D11 54554B/30 ★BE -875-069
omatic finishing of treacle-filled waffles - by transferring and
ssing newly sliced top on already filled bottom
/ERWEIJ A BV 04.04.78-NL-003564
(16.07.79) A21c

ffles with fillings of various kinds and similar products produced from a pre-baked article. The under half of waffle is dosed with the filling and an upper half of a ffle, the bottom of which has been treated already with filling, in a previous operation, is laid on it. The e-baked article from which a start is made, is slit by cutter mechanism into an under half and an over half. e over half of a waffle is laid onto an under half which s been dosed with filling two operational steps earlier.

A large output can be achieved of an improved waffle. e syrup is distributed uniformly and the crumbling away the edges of the waffle is prevented. The appearance is nproved by the show of syrup round the circumference of e product. 23. 3. 79 as 875069 (F1) (15pp1014)

COS/ ★ D11 B/30 ★BR 7708-389
ixer for e.g.dough
DA COSTA O P 15.12.77-BR-008389
(10.07.79) A21c-01/06

SP/ D11 41767Y/24 =GB 1549-145
ontinuous mfr. and packing of rusks - with realigning and lifting
evices on conveyor belt system
LESPEAU B A 12.02.76-FR-003896
*+Q31 Q35 (25.07.79) *BE-851-251 +B65g-47/52*

ppts. for continuous manufacture and packaging of rusks ncludes a conveyor passing rusks through an oven and a usk repositioner at the oven exit supplying a second con- eyor. A batcher forms the rusks into groups, and sup- lies a third conveyor perpendicular to the second. A ocker rotates rusks to position them for packaging.

The batcher pref. includes a forming conveyor at a ower level than the first and second conveyors, and the epositioner includes a comb and an eccentric subjected o alternating movement by a rod, with a retainer holding rusks in a raised position on a receiving sheet. 14.2.77 as 006057 (10pp1358).

KIKU/ D11 18220Y/11 =GB 1549-252
Bread mfr. without antimould agent esp. sodium or calcium
propionate - using wheat and/or rye flour with rice, malt or fruit
vinegar
KIKUHARA I 04.11.75-JA-132284
*(25.07.79) *BE-847-985 A21d-02/08 +C12j-01*

Bread is made from cereal flour, in which the flour contains ≥1 edible vinegar which is rice vinegar, malt vinegar or fruit vinegar in amt. 180-450ml. per 25 kg. of the flour.

Pref. the rice vinegar used is conc. rice vinegar and/o unpolished rice vinegar. The fruit vinegar is cider vinegar, orange vinegar or grape vinegar. Prepn. is by adding the edible vinegar to a cereal flour dough in amt. 260-300 ml. per 25 kg. of flour, the dough then being allowed to rise and baked.

Bread compsn. has a good storage life, as well as improved cellular structure and flavour. Flavour is improved without making the bread taste sour, by virtue of the free amino acids and other nutrients present in the vinegar. 4. 11. 76 as 046012 (5pp931).

TEHN- ★ D11 B/30 ★RU --65-823
Continuous cooking in mechanical oven - employs rotary drum to
produce large thin cooked products

JARV/ ★ D11 B/30 ★SF 7703-053
Appts. for turning edge of sheet of dough
JARVENKYLA J 14.10.77-SF-003053
(29.06.79) A21c

HUAN/ ★ D11 56151B/30 ★US 4160-634
Portable, low power, automatic dumpling-making machine -
comprises dough sheet transmission, stuffing control and feed and
dumpling forming devices
HUANG T H 19.08.77-US-826210
(10.07.79) A21c-09/06

An automatic dumpling mating machine comprises a dough sheet transmission mechanism and a flour container for applying flour to the dough sheets. Stuffing control and feeding devices feed a fixed amt. of stuffing into each doug sheet and a lifting device lifts the central part of each shee to form a dent for receiving a stuffing.

Dumpling forming devices are mounted on the periphera surfaces of two polygon-shaped rotating wheels for folding up the dough sheets after stuffings have been fed in to form a dumpling. A push rod discharges the finished dum -lings from the forming devices into a collector.

Only about 1 hp. is required to operate the machine. Dumplings are made in a sanitary and rapid manner. The machine is compact and is potable. 19.8.77 as 826210 (11p (11pp1044).

PENN ★ D11 56260B/30 ★US 4160-848
Additive for inhibiting staleness in baked goods - comprises glycerol
mono:ester and fatty acid, its sodium, magnesium salts or
pentaerythritol ester
PENNWALT CORP 18.04.77-US-788193
A97 E17 (10.07.79) A21d-02/16

An additive compsn. for retarding staling in baked goods contains (a) a glycerol ester of a 10-24C fatty acid, contg. ≥10% monoester, and (b) 0.25-1 pts. per part glycerol ester, of a 14-20C satd. fatty acid, its sodium or magnesium salts, and/or its pentaerythritol monoester. Pref. (a) contains 30-50 wt.% of the condensation product of the glycerol ester with 10-95 wt.% ethylene oxide. The fatty acid in (b) is pref. stearic acid.

The combination is more effective than known additives. 18.4.77 as 788193 (6pp955).

D12: MEAT; FISH PROCESSING

DANE- ★ D12 B/30 ★DK 7705-432
Bacon cutting system
DANEPAK LTD 07.12.77-DK-005432
P62 (02.07.79) B26d

SCMA D12 69115W/42 =DS 2416-650
Raw fish steamed and dried in open cans - using continuous belt with transverse blades to engage and convey cans
SCHMALBACH-LUBECA 05.04.74-DT-416650
*+Q35 (19.07.79) *DT2416-650 A23l-03/04 +B65g-49*

In a plant to remove the cell water from raw fish or fish products in open tins prior to filling with oil or sauce and closing, an endless chain conveyor is used which has in the central part of its lateral support rails a U-shaped dip. Transverse charging and discharging conveyors transport the open tins to and from the flight trays on the bottom strand chain.

Guide plates hold them during the travel on the bottom strand. The cell water is removed as the tins pass through a steam heating and drying zone. In the top strand, the tins are inverted so that the cell water can drain off through the perforated trays.

This makes the following sterilisation stage safe from contamination by cell water. 5.4.74 as 416650(7pp39)

TEEP D12 50970W/31 =DS 2510-800
Sausage skins of collagen coated with edible powder - which is pref. a vinylic or olefinic polymer, esp. polyethylene, to improve slip and roll qualities
TEE PAK INC 12.03.74-US-450526
*A97 (19.07.79) *BE-826-604 A22c-13*

Edible collagen sausage skins with a powder film on the external surface have improved sheen and rolling properties The powder film comprises a polyolefin, (spherules of dia 0.5-35 µm, 0.15-15 mg/g sausage skin); pref. polyethylene, (2-15 µm diam., 0.75-7.5 mg/g), is used opt. with a small content of finely divided silica (0.1-2 wt%).
12.3.75 as 510800(3pp47)

HUCK- ★ D12 54732B/30 ★DT 2801-545
Sausage sheath of rustic appearance mfr. - using knitted mesh surrounding tubular sausage skin
HUCKFELDT & THORLIC 14.01.78-DT-801545
(19.07.79) A22c-13

A continuous sheath for sausages consists of a tubular skin to which a knitted meshed net is applied on the outside. The net consists of spiral threads which are joined to each other by three to six axial loops. After drying in the inflated state the sheath is ready for packing.

When filled with sausage meat, thissheath has a rustic appearance and has a greater strength than the skin by itself. 14.1.78 as 801545 (9pp39)

NMHB ★ D12 B/30 ★NO 7704-192
Fish filleting machine
NORDISCH MASCH R BAADER 07.12.77-NO-004192
(02.07.79) A22c

MOMD ★ D12 55711B/30 ★SU -626-745
Tubular bone cutting equipment - has stationary and moving knives, the latter moving in a circular trajectory
MOSCOW MEAT DAIRY INST 29.03.77-SU-469066
(11.09.78) A22b-05

Device for sepg. epiphyses from tubular bones includes a stand and stationary and moving knives. Productivity and reliability are improved by positioning the driven knife so that it is capable of circular motion. Both knives are mounted in a frame and their cutting edges have the shape of a straight line and are arranged at an angle to one another equal to 30-70 °C. The bone is fastened into a gripping attachment in such a way that the point at which the epiphysis is to be removed fits into a V-shaped groove, formed by the cutting edges of the stationary knife. The electric motor is started up and the flywheel on the shaft begins to turn.
